

Programming Paradigms - Haskell Instructions

Theodoros Chondrogiannis

2nd Semester 2016/17

Download the file `fac.hs` from the web site, save it on disk, and load it into the interactive shell `ghci`. You can load a file into the shell with `:l <filename>`. Once it has loaded successfully, i.e., there are no errors in the module, the prompt of the shell changes to the name of the module. You are now ready to run any functions included in the module. So try running the function `fac` with different parameters. You can leave the shell with the command `:quit`.
