Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Definition

Given two queries Q_1 and Q_2 we say Q_1 is contained in Q_2 , denoted $Q_1 \subseteq Q_2$, if for every database D we have

$$Q_1(D) \subseteq Q_2(D)$$

$Q(D)$: result of evaluation of Q over D

Query containment

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

- Fundamental issue in query optimisation
- We consider **conjunctive queries** over schemata **schemata with constraints**
- The presence of constraints makes query containment checking difficult
- Need for reasoning on **constraints** imposed by the database schema
- Q_1 contained in Q_2 **under Σ** , denoted $Q_1 \subseteq_{\Sigma} Q_2$, if for every database D **that satisfies Σ** we have $Q_1(D) \subseteq Q_2(D)$

Conjunctive query containment: algorithm

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

- 1 **freeze** $body(Q_1)$ and $head(Q_1)$ by turning each variable into a distinct (fresh) constant
- 2 evaluate Q_2 over the frozen body of Q_1
- 3 $Q_1 \subseteq Q_2$ iff the evaluation returns the frozen head of Q_1

Testing containment amounts to checking the existence of a **query homomorphism** from Q_2 to Q_1 [Chandra & Merlin 1977].

Example

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

From [Ullman 1997]

$$Q_1 : p(X, Z) \leftarrow a(X, Y), a(Y, Z)$$

$$Q_2 : p(X, Z) \leftarrow a(X, U), a(V, Z)$$

Example

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Definition

Given a set Σ of database dependencies, we say Q_1 **is contained in** Q_2 under Σ , denoted $Q_1 \subseteq_{\Sigma} Q_2$, if **for every database** D such that $D \models \Sigma$ we have

$$Q_1(D) \subseteq Q_2(D)$$

Our setting

Queries

- conjunctive queries (CQs)

Dependencies

- 1 key dependencies (KDs)

$$\text{key}(R) = \{A_1, \dots, A_k\}$$

- 2 inclusion dependencies (IDs) (generalisation of foreign key dependencies)

$$R_1[A_1, \dots, A_m] \subseteq R_2[B_1, \dots, B_m]$$

QC under constraints: example

Containment
of Conjunctive

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Schema

employee(*Emp_id*, *Salary*, *Dept*)
department(*Dept*, *Location*)

with constraint $\text{employee}[3] \subseteq \text{department}[1]$.

QC under constraints: example

Containment
of Conjunctive
Queries

Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Schema

employee(*Emp_id*, *Salary*, *Dept*)
department(*Dept*, *Location*)

with constraint $\text{employee}[3] \subseteq \text{department}[1]$.

Queries

$Q_1 : p(X) \leftarrow \text{employee}(X, Y, Z), \text{department}(Z, W)$
 $Q_2 : p(X) \leftarrow \text{employee}(X, Y, Z)$

QC under constraints: example

Schema

employee(*Emp_id*, *Salary*, *Dept*)
department(*Dept*, *Location*)

with constraint $\text{employee}[3] \subseteq \text{department}[1]$.

Queries

$Q_1 : p(X) \leftarrow \text{employee}(X, Y, Z), \text{department}(Z, W)$
 $Q_2 : p(X) \leftarrow \text{employee}(X, Y, Z)$

$Q_1 \subseteq Q_2$ and $Q_2 \not\subseteq Q_1$, but notice that $Q_2 \subseteq_{\Sigma} Q_1$ (queries are equivalent under Σ).

Checking QC under database dependencies

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Intuition

- Once we freeze Q_1 we are constructing a generic database that provides an answer to Q_1
- When we freeze, we must construct a database that satisfies Σ
- We do that by constructing the chase of the frozen query

The chase

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

The chase “repairs” the frozen body of Q_1 in two ways:

- 1 “collapsing” pairs of facts that violate a KD (**KD chase rule**)
- 2 adding facts when an ID is violated (**ID chase rule**)

Containment test under dependencies

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Theorem [Johnson & Klug 1982]

$Q_2 \subseteq_{\Sigma} Q_1$ iff there is a homomorphism that maps $body(Q_2)$ on the chase of the frozen $body(Q_1)$, and the head of Q_2 to the frozen head of Q_1 .

Note

The chase is a representative for all databases that satisfy Σ and provide an answer for Q_1 .

Infinite chase: example

Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

KD chase rule

We collapse the first two facts (due to γ_1) by forcing $\alpha_0 = b$.

ID chase rule

Added facts due to IDs:

$$\begin{aligned} S(a, \alpha_1) &\leftarrow \\ R(\alpha_1, \alpha_2) &\leftarrow \\ S(\alpha_1, \alpha_3) &\leftarrow \\ S(\alpha_1, \alpha_4) &\leftarrow \\ R(\alpha_3, \alpha_5) &\leftarrow \\ S(\alpha_3, \alpha_6) &\leftarrow \\ \dots & \end{aligned}$$

(... ad infinitum!)

Chase graph

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

- Facts in the frozen body of Q_1 have level 0. A fact derived from the ID chase rule from another fact that is at level k has level $k + 1$
- If fact f_2 is derived from fact f_1 by an ID σ , there is an arc (f_1, f_2) labelled with σ

Example: chase graph

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Known result

QC under general functional dep. and IDs is undecidable
[Chandra & Vardi 1982]

Theorem

QC under general KDs and IDs is undecidable

Proof sketch: Reduction from implication of KDs and IDs.
Consider R/n , S/m , a set of dep. Σ and a constraint
 $\sigma : R[1, \dots, k] \subseteq S[1, \dots, k]$.

$$\begin{aligned} Q_1 : Q() &\leftarrow R(X_1, \dots, X_k, \dots, X_n) \\ Q_2 : Q() &\leftarrow R(X_1, \dots, X_k, \dots, X_n), \\ &S(X_1, \dots, X_k, Y_1, \dots, Y_{m-k}) \end{aligned}$$

it is easy to see that $Q_1 \subseteq_{\Sigma} Q_2$ iff $\Sigma \models \sigma$.

QC under IDs alone

Theorem [Johnson & Klug JCSS 1984]

Containment is decidable in PSPACE.

Proof sketch:

- only a finite portion of the chase is necessary
- notion of **equivalent conjuncts** (agree on non-fresh constants)
- given a fact, an equivalent conjunct is found within $\delta = |\Sigma| \cdot (W + 1)^W$, W maximum “width” of IDs in Σ
- Taking into account joins in Q_2 : the necessary depth is $|Q_2| \cdot \delta$
- A nontrivial guess shows memberships in PSPACE
- PSPACE-hardness is also proved (like undecidability)

QC under KDs and IDs: decidable cases

of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Definition

Non-key-conflicting IDs (NKCIDs) are of the form

$$R_1[\mathbf{A}_1] \subseteq R_2[\mathbf{A}_2]$$

where either:

- 1 no KD is defined over r_2
- 2 \mathbf{A}_2 is **not** a strict superset of $key(R_2)$

Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Theorem

Given Q_1 , Q_2 , Σ (NKCIDs), if the chase w.r.t. Σ does not fail in the first applications of the FD chase rule:

$$Q_1 \subseteq Q_2 \text{ iff } Q_1 \subseteq_{\Sigma} Q_2$$

Proof

Based on the fact that if KDs are not violated in the first step of the chase, they are never violated

Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

- We consider a conceptual model (**Extended ER, EER**) derived by enriching Chen's ER model
- Conjunctive queries formulated on predicates referring the the constructs of the conceptual schema
- Need for checking containment **under constraints** derived from the conceptual schema
- Constraints are represented with **inclusion dependencies (IDs)** and **key dependencies (KDs)**
- ★ Decidability of query containment approaches

Extended ER schemata

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

We consider ER schemata enriched with:

- IS-A among entities **and relationships**
- mandatory (at least once) participation constraints
- functional (at most once) participation constraints

Extended ER schemata

We consider ER schemata enriched with:

- IS-A among entities **and relationships**
- mandatory (at least once) participation constraints
- functional (at most once) participation constraints

Relational representation of EER schemata:

- entities \rightarrow unary relations
- relationships \rightarrow n-ary relations
- attributes \rightarrow n-ary relations (binary for entities)
- mandatory participation constraints \rightarrow IDs
- functional participation constraints \rightarrow KDs

Representing and querying ER schemata: example

Containment
of Conjunctive
Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Representing and querying ER schemata: example

Constraints: they are always key and inclusion dependencies

$$\begin{aligned} \text{employee}[1] &\subseteq \text{works_in}[1] \\ \text{key}(\text{works_in}) &= \{1\} \\ \text{manager}[1] &\subseteq \text{employee}[1] \end{aligned}$$

...

Representing and querying ER schemata: example

Constraints: they are always key and inclusion dependencies

$$\begin{aligned} \text{employee}[1] &\subseteq \text{works_in}[1] \\ \text{key}(\text{works_in}) &= \{1\} \\ \text{manager}[1] &\subseteq \text{employee}[1] \end{aligned}$$

...

$$Q(X) \leftarrow \text{manager}(X), \text{works_in}(X, Y), \text{since}(X, Y, 1999) \\ \text{dept}(Y), \text{dept_name}(Y, \text{toy_dept})$$

The chase as a tool for containment checking: recall

The **chase** of a query database is obtained by:

- 1 “freezing” the query:
 - turn each atom into a fact
 - leave constants unaltered
 - turn variables into “fresh” constants
- 2 adding facts to satisfy IDs;
- 3 collapsing (if possible) facts to satisfy KDs

The chase as a tool for containment checking: recall

The **chase** of a query database is obtained by:

- 1 “freezing” the query:
 - turn each atom into a fact
 - leave constants unaltered
 - turn variables into “fresh” constants
- 2 adding facts to satisfy IDs;
- 3 collapsing (if possible) facts to satisfy KDs

To check $Q_1 \subseteq_{\Sigma} Q_2$:

- 1 we consider the chase of Q_1
- 2 we evaluate Q_2 over such chase
- 3 if the evaluation returns the frozen head of Q_1 , then $Q_1 \subseteq_{\Sigma} Q_2$

Chase for EER dependencies: example

Initial facts (frozen query):

$\text{manager}(m) \leftarrow$
 $\text{manages}(m, d) \leftarrow$

Chase for EER dependencies: example

Initial facts (frozen query):

$\text{manager}(m) \leftarrow$
 $\text{manages}(m, d) \leftarrow$

Facts added in the chase:

$\text{employee}(m) \leftarrow$
 $\text{works_in}(m, \alpha) \leftarrow$
 $\text{works_in}(m, d) \leftarrow$
 $\text{dept}(\alpha) \leftarrow$
 $\text{dept}(d) \leftarrow$

Chase for EER dependencies: example

Initial facts (frozen query):

$\text{manager}(m) \leftarrow$
 $\text{manages}(m, d) \leftarrow$

Facts added in the chase:

$\text{employee}(m) \leftarrow$
 $\text{works_in}(m, \alpha) \leftarrow$
 $\text{works_in}(m, d) \leftarrow$
 $\text{dept}(\alpha) \leftarrow$
 $\text{dept}(d) \leftarrow$

We must deduce $\alpha = d$ (α is a **fresh** constant) and replace this value in all the segment of the chase constructed so far.

Queries
Over
Conceptual
Schemata

Andrea Cali

Introduction

Query
containment
under
database
constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Chase for EER dependencies: properties

- Violations of KDs are possible only in a very initial segment
- We prove that a **finite segment** of the chase, until depth $|\Sigma| \cdot W! \cdot |Q_2|$, is sufficient to test containment
 - W is the maximum number of attributes involved by an ID in Σ ;
- In principle we do not know how far we should go with the chase until we stop, since **collapses may propagate back** from some “deep” (late) part

constraints

QC with the
chase

Containment
of queries over
conceptual
schemata

Conclusions

Containment check $Q_1 \subseteq_{\Sigma} Q_2$:

Main result

Propagation of collapses between constants does not go back more than a fixed “distance” in the chase; such distance is $|\Sigma| \cdot W!$

Technique

We proceed until level $|\Sigma| \cdot W! \cdot |Q_2|$ (initial segment) plus another $|\Sigma| \cdot W!$ levels

- 1 after that no collapse will affect the initial segment;
- 2 the segment we have is enough for checking query containment

Conclusions

Containment under KDs and IDs

- Chase technique: [Beeri & Vardi JACM 1984]
- Case of IDs alone: treated in [Johnson & Klug JCSS 1984]: containment in PSPACE
- Extension to in [Cali et al. PODS 2003] to KDs and **non-key-conflicting IDs** (NKCIDs), again in PSPACE

Conclusions

Containment on EER schemata

- Decidability of the QC problem on EER schemata derived from [Calvanese et al. PODS 1998] by encoding into CPDL;
- We achieve a **lower complexity** by providing a direct insight into the structure of the chase
- Other relevant approaches:
 - DL-Lite [Calvanese et al. KR 2005] (captures conceptual schemata without IS-A among n-ary roles)
 - [Ortiz et al. 2005] (higher expressiveness and complexity)
