# Outline

Limitations of RDFS

Web Ontology Language OWL

- Design of OWL

- OWL Layering

- OWL and Description Logics

- OWL Syntaxes

## RDFS as an Ontology Language

- ▶ Classes
- ▶ Properties
- ▶ Class hierarchies
- ▶ Property hierarchies
- ▶ Domain and range restrictions

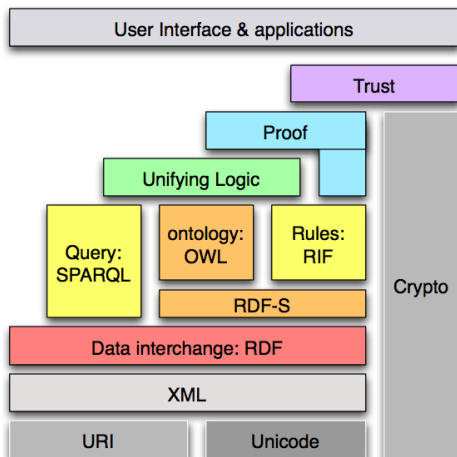

## Expressive limitations of RDF(S)

- ▶ Only binary relations
- ▶ Characteristics of Properties (e.g. inverse, transitive, symmetric)
- ▶ Local range restrictions (e.g. for Class Person, the property `hasName` has range `xsd:string`)
- ▶ Complex concept descriptions (e.g. Person is defined by Man and Woman)
- ▶ Cardinality restrictions (e.g. a Person may have at most 1 name)
- ▶ Disjointness axioms (e.g. nobody can be both a Man and a Woman)

## Layering issues

- ▶ Syntax
  - ▶ Only binary relations in RDF
  - ▶ Verbose Syntax
  - ▶ No limitations on graph in RDF
    - ▶ Every graph is valid
- ▶ Semantics
  - ▶ Malformed graphs
  - ▶ Use of vocabulary in language
    - ▶ e.g.  $\langle \text{rdfs:Class}, \text{rdfs:subClassOf}, \text{ex:a} \rangle$
  - ▶ Meta-classes
    - ▶ e.g.  $\langle \text{ex:a}, \text{rdf:type}, \text{ex:a} \rangle$

## Where were we?

[following slides in part due to Frank van Harmelen

## Stack of Languages

- ▶ XML
  - ▶ Surface syntax, no semantics
- ▶ XML Schema
  - ▶ Describes structure of XML documents
- ▶ RDF
  - ▶ Datamodel for “relations” between “things”
- ▶ RDF Schema
  - ▶ RDF Vocabulary Definition Language
- ▶ OWL
  - ▶ A more expressive Vocabulary Definition Language

## RDF Schema recap

- ▶ RDFS provides
  - ▶ Classes
  - ▶ Class hierarchies
  - ▶ Properties
  - ▶ Property hierarchies
  - ▶ Domain and range restrictions
- ▶ RDFS does not provide
  - ▶ Property characteristics (inverse, transitive, ...)
  - ▶ Local range restrictions
  - ▶ Complex concept definitions
  - ▶ Cardinality restrictions
  - ▶ Disjointness axioms

## Extending RDF Schema

- ▶ OWL extends RDF Schema to a full-fledged knowledge representation language for the Web
  - ▶ Logical expressions (and, or, not)
  - ▶ (in)equality
  - ▶ local properties
  - ▶ required/optional properties
  - ▶ required values
  - ▶ enumerated classes
  - ▶ symmetry, inverse

## Design Goals for OWL

- ▶ **Shareable**
- ▶ **Changing** over time
- ▶ **Interoperability**
- ▶ **Inconsistency** detection
- ▶ Balancing **expressivity and complexity**
- ▶ **Ease of use**
- ▶ Compatible with **existing standards**
- ▶ **Internationalisation**

## Requirements for OWL

- ▶ Ontologies are **object on the Web**
- ▶ with **their own meta-data**, versioning, etc...
- ▶ Ontologies are **extendable**
- ▶ They contain **classes, properties, data-types, range/domain, individuals**
- ▶ **Equality** (for classes, for individuals)
- ▶ **Classes as instances**
- ▶ **Cardinality** constraints
- ▶ **XML** syntax

## Objectives for OWL

### Objectives:

- ▶ layered language
- ▶ complex datatypes
- ▶ digital signatures
- ▶ decidability (in part)
- ▶ local unique names (in part)

### Disregarded:

- ▶ default values
- ▶ closed world option
- ▶ property chaining
- ▶ arithmetic
- ▶ string operations
- ▶ partial imports
- ▶ view definitions
- ▶ procedural attachments

## Language layers of OWL

- ▶ OWL Lite
  - ▶ Classification hierarchy
  - ▶ Simple constraints
- ▶ OWL DL
  - ▶ Maximal expressiveness
  - ▶ While maintaining tractability
  - ▶ Standard formalisation in a DL
- ▶ OWL Full
  - ▶ Very high expressiveness
  - ▶ Losing tractability
  - ▶ All syntactic freedom of RDF (self-modifying)

## Features of OWL language layers

### ▶ OWL Lite

- ▶ (sub)classes, individuals
- ▶ (sub)properties, domain, range
- ▶ conjunction
- ▶ (in)equality
- ▶ cardinality 0/1
- ▶ datatypes
- ▶ inverse, transitive, symmetric properties
- ▶ someValuesFrom
- ▶ allValuesFrom

### ▶ OWL DL

- ▶ Negation
- ▶ Disjunction
- ▶ Full cardinality
- ▶ Enumerated types
- ▶ hasValue

### ▶ OWL Full

- ▶ Meta-classes
- ▶ Modify language

## OWL Full

- ▶ **No restriction on use of vocabulary** (as long as legal RDF)
  - ▶ Classes as instances (and much more)
- ▶ **RDF style model theory**
  - ▶ Reasoning using FOL engine
  - ▶ Semantics should correspond to OWL DL for restricted KBs

## OWL DL

- ▶ Use of vocabulary restricted
  - ▶ Can't be used to do “nasty things” (e.g. modify OWL)
  - ▶ No classes as instances
  - ▶ Defined by abstract syntax
- ▶ Standard DL-based model theory
  - ▶ Direct correspondence with a DL
  - ▶ Reasoning via DL engines

## OWL Lite

- ▶ No explicit negation or union
- ▶ Restricted cardinality (0/1)
- ▶ No nominals (oneOf)
- ▶ DL-based semantics
  - ▶ Reasoning via DL engines (+datatypes)
- ▶ Semantically, only small restriction on OWL DL
  - ▶ No nominals
  - ▶ No arbitrary cardinality

## OWL and Description Logics

- ▶ OWL Lite corresponds to the DL  $\mathcal{SHIF}(\mathbf{D})$ 
  - ▶ Named classes ( $A$ )
  - ▶ Named properties ( $P$ )
  - ▶ Individuals ( $C(o)$ )
  - ▶ Property values ( $P(o, a)$ )
  - ▶ Intersection ( $C \sqcap D$ )
  - ▶ Union(!) ( $C \sqcup D$ )
  - ▶ Negation(!) ( $\neg C$ )
  - ▶ Existential value restrictions ( $\exists P.C$ )
  - ▶ Universal value restrictions ( $\forall P.C$ )
  - ▶ Unqualified (0/1) number restrictions ( $\geq nP, \leq nP, = nP$ ),  
 $0 \leq n \leq 1$ )
- ▶ OWL DL corresponds to the DL  $\mathcal{SHOIN}(\mathbf{D})$ 
  - ▶ Arbitrary number restrictions ( $\geq nP, \leq nP, = nP$ ),  $0 \leq n$
  - ▶ Property value ( $\exists P.\{o\}$ )
  - ▶ Enumeration ( $\{o_1, \dots, o_n\}$ )

## OWL constructs

OWL Construct	DL	Example
intersectionOf	$C_1 \sqcap \dots \sqcap C_n$	<i>Human</i> $\sqcap$ <i>Male</i>
unionOf	$C_1 \sqcup \dots \sqcup C_n$	<i>Doctor</i> $\sqcup$ <i>Lawyer</i>
complementOf	$\neg C$	$\neg$ <i>Male</i>
oneOf	$\{o_1, \dots, o_n\}$	$\{john, mary\}$
allValuesFrom	$\forall P.C$	$\forall hasChild.Doctor$
someValuesFrom	$\exists P.C$	$\exists hasChild.Lawyer$
value	$\exists P.\{o\}$	$\exists citizenOf.USA$
minCardinality	$\geq nP.C$	$\geq 2hasChild.Lawyer$
maxCardinality	$\leq nP.C$	$\leq 1hasChild.Male$
cardinality	$= nP.C$	$= 1hasParent.Female$

+ XML Schema datatypes: int, string, real, etc...

## OWL axioms

OWL Axiom	DL	Example
SubClassOf	$C_1 \sqsubseteq C_2$	<i>Human</i> $\sqsubseteq$ <i>Animal</i> $\sqcap$ <i>Biped</i>
EquivalentClasses	$C_1 \equiv \dots \equiv C_n$	<i>Man</i> $\equiv$ <i>Human</i> $\sqcap$ <i>Male</i>
SubPropertyOf	$P_1 \sqsubseteq P_2$	<i>hasDaughter</i> $\sqsubseteq$ <i>hasChild</i>
EquivalentProperties	$P_1 \equiv \dots \equiv P_n$	<i>cost</i> $\equiv$ <i>price</i>
SameIndividual	$o_1 = \dots = o_n$	<i>President_Bush</i> = <i>G_W_Bush</i>
DisjointClasses	$C_i \sqsubseteq \neg C_j$	<i>Male</i> $\sqsubseteq \neg$ <i>Female</i>
DifferentIndividuals	$o_i \neq o_j$	<i>john</i> $\neq$ <i>peter</i>
inverseOf	$P_1 \equiv P_2^-$	<i>hasChild</i> $\equiv$ <i>hasParent</i> <sup>-</sup>
Transitive	$P^+ \sqsubseteq P$	<i>ancestor</i> <sup>+</sup> $\sqsubseteq$ <i>ancestor</i>
Symmetric	$P \equiv P^-$	<i>connectedTo</i> $\equiv$ <i>connectedTo</i> <sup>-</sup>

## More on OWL species

- ▶ OWL Full is **not** a Description Logic
- ▶ OWL Lite has strong syntactic restrictions, but only limited semantics restrictions, compared with OWL DL
  - ▶ Negation can be encoded using disjointness
  - ▶ With negation and conjunction, you can encode disjunction

`Class(C complete unionOf(B C))`

is equivalent to:

`DisjointClasses(notB B)`

`DisjointClasses(notC C)`

`Class(notBandnotC complete notB notC)`

`DisjointClasses(notBandnotC BorC)`

`Class(C complete notBandnotC)`

## More on layering

- ▶ For an OWL DL-restricted KB, OWL Full semantics is **not** equivalent to OWL DL semantics

John friend Susan .

OWL Full entails:

John rdf:type owl:Thing . Susan rdf:type owl:Thing . friend  
rdf:type owl:ObjectProperty .

John rdf:type \_:x . \_:x owl:onProperty friend . \_:x  
owl:minCardinality "1"^^xsd:nonNegativeInteger .

## Syntaxes of OWL

- ▶ RDF
  - ▶ Official exchange syntax
  - ▶ Hard for humans
  - ▶ RDF parsers are hard to write!
- ▶ UML
  - ▶ Large user base
- ▶ XML
  - ▶ Not the RDF syntax
  - ▶ Better for humans
  - ▶ More XML than RDF tools available
- ▶ Abstract syntax
  - ▶ Not defined for OWL Full
  - ▶ Human readable

## OWL in RDF/XML

Example from [OwlGuide]:

```
<!ENTITY vin
"http://www.w3.org/TR/2004/REC-owl-guide-20040210/wine#" >
<!ENTITY food
"http://www.w3.org/TR/2004/REC-owl-guide-20040210/food#" > ...
<rdf:RDF
xmlns:vin="http://www.w3.org/TR/2004/REC-owl-guide-20040210/wine#"
xmlns:food="http://www.w3.org/TR/2004/REC-owl-guide-20040210/food#"
... >
```

```
<owl:Class rdf:ID="Wine" > <rdfs:subClassOf
rdf:resource="&food;PotableLiquid" /> <rdfs:label
xml:lang="en" >wine</rdfs:label> <rdfs:label
xml:lang="fr" >vin</rdfs:label> ... </owl:Class>
```

```
<owl:Class rdf:ID="Pasta" > <rdfs:subClassOf
rdf:resource=" #EdibleThing" /> ... </owl:Class> </rdf:RDF>
```

## OWL Abstract syntax

Class( professor partial ) Class( associateProfessor partial  
academicStaffMember)

DisjointClasses ( associateProfessor assistantProfessor )

DisjointClasses ( professor associateProfessor )

Class( faculty complete academicStaffMember)

## OWL Abstract syntax

In DL syntax:

associateProfessor  $\sqsubseteq$  academicStaffMember

associateProfessor  $\sqsubseteq \neg$  assistantProfessor

professor  $\sqsubseteq \neg$  associateProfessor

faculty  $\equiv$  academicStaffMember

## More examples

DatatypeProperty(age range(xsd:nonNegativeInteger))

ObjectProperty( lecturesIn )

ObjectProperty(isTaughtBy domain(course) range(academicStaffMember))

SubPropertyOf(isTaughtBy involves)

ObjectProperty(teaches inverseOf(isTaughtBy)

domain(academicStaffMember) range(course))

EquivalentProperties ( lecturesIn teaches)

ObjectProperty(hasSameGradeAs Transitive Symmetric domain(student)

range(student))

## More examples

In DL syntax:

$\top \sqsubseteq \forall \text{age.xsd} : \text{nonNegativeInteger}$

$\top \sqsubseteq \forall \text{isTaughtBy}^- . \text{course}$

$\top \sqsubseteq \forall \text{isTaughtBy} . \text{academicStaffMember}$

$\text{isTaughtBy} \sqsubseteq \text{involves}$

$\text{teaches} \equiv \text{isTaughtBy}^-$

$\top \sqsubseteq \forall \text{teaches}^- . \text{academicStaffMember}$

$\top \sqsubseteq \forall \text{teaches} . \text{course}$

$\text{lecturesIn} \equiv \text{teaches}$

$\text{hasSameGradeAs}^+ \sqsubseteq \text{hasSameGradeAs}$

$\text{hasSameGradeAs} \equiv \text{hasSameGradeAs}^-$

$\top \sqsubseteq \forall \text{hasSameGradeAs}^- . \text{student}$

$\top \sqsubseteq \forall \text{hasSameGradeAs} . \text{student}$

## More examples

Individual (949318 type( lecturer ))

Individual (949352 type(academicStaffMember) value(age  
"39"^^&xsd;integer))

ObjectProperty(isTaughtBy Functional)

Individual (CIT1111 type(course) value(isTaughtBy 949352)  
value(isTaughtBy 949318))

DifferentIndividuals (949318 949352) DifferentIndividuals (949352  
949111 949318)

## More examples

In DL syntax:

949318 : *lecturer*

949352 : *academicStaffMember*

$\langle 949352, "39" \text{^^} \& \text{xsd}; \text{integer} \rangle$  : *age*

$\top \sqsubseteq \leq 1$  *isTaughtBy*

*CIT1111* : *course*

$\langle \textit{CIT1111}, 949352 \rangle$  : *isTaughtBy*

$\langle \textit{CIT1111}, 949318 \rangle$  : *isTaughtBy*

949318  $\neq$  949352

949352  $\neq$  949111

949111  $\neq$  949318

949352  $\neq$  949318

## More examples

```
Class( firstYearCourse partial restriction (isTaughtBy allValuesFrom  
( Professor )))
```

```
Class(mathCourse partial restriction (isTaughtBy hasValue (949352)))
```

```
Class(academicStaffMember partial restriction (teaches someValuesFrom  
( undergraduateCourse )))
```

```
Class(course partial restriction (isTaughtBy minCardinality(1)))
```

```
Class(department partial restriction (hasMember minCardinality(10))  
restriction (hasMember maxCardinality(30)))
```

## More examples

In DL syntax:

*firstYearCourse*  $\sqsubseteq \forall isTaughtBy. Professor$

*mathCourse*  $\sqsubseteq \exists isTaughtBy. \{949352\}$

*academicStaffMember*  $\sqsubseteq \exists teaches. undergraduateCourse$

*course*  $\sqsubseteq_{\geq 1} isTaughtBy$

*department*  $\sqsubseteq_{\geq 10} hasMember \sqcap \leq 30 hasMember$

## More examples

```
Class(course partial complementOf(staffMember))
```

```
Class(peopleAtUni complete unionOf(staffMember student))
```

```
Class(facultyInCS complete intersectionOf ( faculty  
restriction (belongsTo hasValue (CSDepartment))))
```

```
Class(adminStaff complete intersectionOf ( staffMember  
complementOf(unionOf(faculty techSupportStaff))))
```

## More examples

In DL syntax:

$course \sqsubseteq \neg staffMember$

$peopleAtUni \equiv staffMember \sqcup student$

$facultyInCS \equiv faculty \sqcap \exists belongsTo. \{CSDepartment\}$

$adminStaff \equiv staffMember \sqcap \neg (faculty \sqcup techSupportStaff)$
