# **Knowledge bases**

Inference engine— domain-independent algorithmsKnowledge base— domain-specific content

- Knowledge base = set of *sentences* in a *formal* language = logical *theory*
- Declarative approach to building an intelligent agent: TELL it what it needs to know
- Then it can Ask itself what to do—answers should follow from the KB
- Agents can be viewed at the knowledge level
   i.e., what they know, regardless of how implemented
- Or at the *implementation level*

i.e., data structures in KB and algorithms that manipulate them

# Logic in general

- *Logics* are formal languages for representing information such that conclusions can be drawn
- *Syntax* defines the sentences in the language
- Semantics define the "meaning" of sentences; i.e., define truth of a sentence in a world
- E.g., the language of arithmetic

 $x + 2 \ge y$  is a sentence; x2 + y > is not a sentence

 $x+2 \geq y$  is true iff the number x+2 is no less than the number y

 $x+2 \geq y$  is true in a world where  $x=7, \ y=1$ 

 $x+2 \ge y$  is false in a world where x=0, y=6

 $x+2 \geq x+1$  is true in every world

# The one and only Logic?

- Logics of higher order
- Modal logics
  - $\circ$  epistemic
  - $\circ$  temporal and spatial
  - 0 ...
- Description logic
- Non-monotonic logic
- Intuitionistic logic

• . . .

But: There are "standard approaches"

 $\rightsquigarrow$  propositional and predicate logic

# **Types of logic**

- Logics are characterized by what they commit to as "primitives"
- Ontological commitment: what exists—facts? objects? time? beliefs?
- Epistemological commitment: what states of knowledge?

Language	Ontological Commitment (What exists in the world)	Epistemological Commitment (What an agent believes about facts)
Propositional logic	facts	true/false/unknown
First-order logic	facts, objects, relations	true/false/unknown
Temporal logic	facts, objects, relations, times	true/false/unknown
Probability theory	facts	degree of belief 01
Fuzzy logic	degree of truth	degree of belief 01

## Classical logics are based on the notion of TRUTH

# **Entailment – Logical Implication**

• Knowledge base KB entails sentence  $\alpha$  if and only if  $\alpha$  is true in all worlds where KB is true

• E.g., the KB containing "Manchester United won" and "Manchester City won" entails "Either Manchester United won or Manchester City won"

### **Models**

- Logicians typically think in terms of *models*, which are formally *structured worlds* with respect to which truth can be evaluated
- We say m is a *model* of a sentence  $\alpha$  if  $\alpha$  is true in m
- $M(\alpha)$  is the set of all models of  $\alpha$
- Then  $KB \models \alpha$  if and only if  $M(KB) \subseteq M(\alpha)$

• E.g. 
$$KB$$
 = United won and City won  $\alpha$  = City won

or

 $\alpha$  = Manchester won

or

 $\alpha$  = either City or Manchester won

## **Inference – Deduction – Reasoning**

$$KB \vdash_i \alpha$$

- $KB \vdash_i \alpha$  = sentence  $\alpha$  can be derived from KB by **procedure** *i*
- Soundness: i is sound if

whenever  $KB \vdash_i \alpha$ , it is also true that  $KB \models \alpha$ 

• *Completeness*: *i* is complete if

whenever  $KB \models \alpha$ , it is also true that  $KB \vdash_i \alpha$ 

 We will define a logic (first-order logic) which is expressive enough to say almost anything of interest, and for which there exists a sound and complete inference procedure.

# **Propositional Logics: Basic Ideas**

#### Statements:

The elementary building blocks of propositional logic are *atomic statements* that cannot be decomposed any further: *propositions*. E.g.,

- "The block is red"
- "The proof of the pudding is in the eating"
- "It is raining"

and logical connectives "and", "or", "not", by which we can build **propositional formulas**.

# **Propositional Logics: Reasoning**

We are interested in the questions:

- when is a statement **logically implied** by a set of statements, in symbols:  $\Theta \models \phi$
- can we define deduction in such a way that deduction and entailment coincide?

# **Syntax of Propositional Logic**

Countable alphabet  $\Sigma$  of **atomic propositions**:  $a, b, c, \ldots$ 

Propositional formulas:

- Atom: atomic formula
- Literal: (negated) atomic formula
- Clause: disjunction of literals

### **Semantics: Intuition**

- Atomic statements can be *true* T or *false* F.
- The truth value of formulas is determined by the truth values of the atoms (*truth value assignment* or *interpretation*).

**Example:**  $(a \lor b) \land c$ 

- If a and b are wrong and c is true, then the formula is not true.
- Then *logical entailment* could be defined as follows:
- $\phi$  is implied by  $\Theta$ , if  $\phi$  is true in all "states of the world", in which  $\Theta$  is true.

### **Semantics: Formally**

A truth value assignment (or interpretation) of the atoms in  $\Sigma$  is a function  $\mathcal{I}$ :

$$\mathcal{I}: \Sigma \to \{\mathsf{T}, \mathsf{F}\}.$$

Instead of  $\mathcal{I}(a)$  we also write  $a^{\mathcal{I}}$ .

A formula  $\phi$  is *satisfied* by an interpretation  $\mathcal{I}$  ( $\mathcal{I} \models \phi$ ) or is *true* under  $\mathcal{I}$ :

$$\mathcal{I}: \left\{ \begin{array}{rrrr} a & \mapsto & \mathsf{T} \\ b & \mapsto & \mathsf{F} \\ c & \mapsto & \mathsf{F} \\ d & \mapsto & \mathsf{T} \\ \vdots \end{array} \right.$$

$$((a \lor b) \leftrightarrow (c \lor d)) \land (\neg (a \land b) \lor (c \land \neg d)).$$

### **Exercise**

- Find an interpretation and a formula such that the formula is true in that interpretation (or: the interpretation satisfies the formula).
- Find an interpretation and a formula such that the formula is not true in that interpretation (or: the interpretation does not satisfy the formula).
- Find a formula which can't be true in any interpretation (or: no interpretation can satisfy the formula).

# **Satisfiability and Validity**

An interpretation  ${\mathcal I}$  is a **model** of  $\phi$ :

$$\mathcal{I} \models \phi$$

A formula  $\phi$  is

- **satisfiable**, if there is some  $\mathcal{I}$  that satisfies  $\phi$ ,
- **unsatisfiable**, if  $\phi$  is not satisfiable,
- falsifiable, if there is some  $\mathcal I$  that does not satisfy  $\phi$ ,
- valid (i.e., a tautology), if every  $\mathcal{I}$  is a model of  $\phi$ .

Two formulas are **logically equivalent** ( $\phi \equiv \psi$ ), if for all  $\mathcal{I}$ :

$$\mathcal{I} \models \phi \text{ iff } \mathcal{I} \models \psi$$

Satisfiable, tautology?

$$(((a \land b) \leftrightarrow a) \rightarrow b)$$
$$((\neg \phi \rightarrow \neg \psi) \rightarrow (\psi \rightarrow \phi))$$
$$(a \lor b \lor \neg c) \land (\neg a \lor \neg b \lor d) \land (\neg a \lor b \lor \neg d)$$

Equivalent?

$$\begin{array}{ll} (\phi \lor (\psi \land \chi)) & \equiv & ((\phi \lor \psi) \land (\psi \land \chi)) \\ \neg (\phi \lor \psi) & \equiv & \neg \phi \land \neg \psi \end{array}$$

### Consequences

#### **Proposition:**

- $\phi$  is a tautology iff  $\neg\phi$  is unsatisfiable
- $\phi$  is unsatisfiable iff  $\neg \phi$  is a tautology.

**Proposition:**  $\phi \equiv \psi$  iff  $\phi \leftrightarrow \psi$  is a tautology.

**Theorem:** If  $\phi$  and  $\psi$  are equivalent, and  $\chi'$  results from replacing  $\phi$  in  $\chi$  by  $\psi$ , then  $\chi$  and  $\chi'$  are equivalent.

### Entailment

Extension of the entailment relationship to sets of formulas  $\Theta$ :

 $\mathcal{I} \models \Theta \quad \text{iff} \quad \mathcal{I} \models \phi \text{ for all } \phi \in \Theta$ 

Remember: we want the formula  $\phi$  to be implied by a set  $\Theta$ , if  $\phi$  is true in all models of  $\Theta$  (symbolically,  $\Theta \models \phi$ ):

 $\Theta \models \phi \quad \text{iff} \quad \mathcal{I} \models \phi \ \text{ for all models } \mathcal{I} \ \text{of } \Theta$ 

Let  $\alpha = A \lor B$  and  $KB = (A \lor C) \land (B \lor \neg C)$ 

Is it the case that  $KB \models \alpha$ ?

A	В	C	$A \lor C$	$B \vee \neg C$	KB	α

# **Properties of Entailment**

- $\Theta \cup \{\phi\} \models \psi \text{ iff } \Theta \models \phi \rightarrow \psi$ (Deduction Theorem)
- $\Theta \cup \{\phi\} \models \neg \psi$  iff  $\Theta \cup \{\psi\} \models \neg \phi$ (Contraposition Theorem)
- $\Theta \cup \{\phi\}$  is unsatisfiable iff  $\Theta \models \neg \phi$ (Contradiction Theorem)

# **Equivalences (I)**

Commutativity	$\phi \lor \psi$	$\equiv$	$\psi \lor \phi$
	$\phi \wedge \psi$	≡	$\psi \wedge \phi$
	$\phi \leftrightarrow \psi$	≡	$\psi \leftrightarrow \phi$
Associativity	$(\phi \lor \psi) \lor \chi$	≡	$\phi \lor (\psi \lor \chi)$
	$(\phi \land \psi) \land \chi$	≡	$\phi \wedge (\psi \wedge \chi)$
Idempotence	$\phi \lor \phi$	≡	$\phi$
	$\phi \wedge \phi$	≡	$\phi$
Absorption	$\phi \lor (\phi \land \psi)$	≡	$\phi$
	$\phi \land (\phi \lor \psi)$	≡	$\phi$
Distributivity	$\phi \land (\psi \lor \chi)$	≡	$(\phi \land \psi) \lor (\phi \land \chi)$
	$\phi \lor (\psi \land \chi)$	$\equiv$	$(\phi \lor \psi) \land (\phi \lor \chi)$

# **Equivalences (II)**

$\phi \vee \top$	$\equiv$	Т
$\phi \wedge \bot$	$\equiv$	$\bot$
$\phi \vee \neg \phi$	$\equiv$	Т
$\phi \wedge \neg \phi$	$\equiv$	$\perp$
$\phi \wedge \top$	$\equiv$	$\phi$
$\phi \lor \bot$	$\equiv$	$\phi$
$\neg \neg \phi$	$\equiv$	$\phi$
$\neg(\phi \lor \psi)$	$\equiv$	$\neg\phi\wedge\neg\psi$
$\neg(\phi \wedge \psi)$	≡	$\neg\phi \lor \neg\psi$
	$\phi \lor \top$ $\phi \land \bot$ $\phi \lor \neg \phi$ $\phi \land \neg \phi$ $\phi \land \top$ $\phi \lor \bot$ $\neg \neg \phi$ $\neg (\phi \lor \psi)$ $\neg (\phi \land \psi)$	$\begin{array}{c} \phi \lor \top &\equiv \\ \phi \land \bot &\equiv \\ \phi \lor \neg \phi &\equiv \\ \phi \land \neg \phi &\equiv \\ \phi \land \neg \phi &\equiv \\ \phi \land \top &\equiv \\ \phi \lor \bot &\equiv \\ \neg \neg \phi &\equiv \\ \neg (\phi \lor \psi) &\equiv \\ \neg (\phi \land \psi) &\equiv \end{array}$

Implication  $\phi \rightarrow \psi \equiv \neg \phi \lor \psi$ 

### **Normal Forms**

Other approaches to inference use syntactic operations on sentences, often expressed in standardized forms

Conjunctive Normal Form (CNF) conjunction of disjunctions of literals: clauses E.g.,  $(A \lor \neg B) \land (B \lor \neg C \lor \neg D)$ Disjunctive Normal Form (DNF) disjunction of conjunctions of literals: terms

E.g., 
$$(A \land B) \lor (A \land \neg C) \lor (A \land \neg D) \lor (\neg B \land \neg C) \lor (\neg B \land \neg D)$$

### Normal Forms, cont.

Horn Form (restricted)

*conjunction* of *Horn clauses* (clauses with  $\leq 1$  positive literal) E.g.,  $(A \lor \neg B) \land (B \lor \neg C \lor \neg D)$ Often written as set of implications:  $B \Rightarrow A$  and  $(C \land D) \Rightarrow B$ 

**Theorem** For every formula, there exists an equivalent formula in CNF and one in DNF.

# Why Normal Forms?

- We can transform propositional formulas, in particular, we can construct their CNF and DNF.
- DNF tells us something as to whether a formula is satisfiable. If all disjuncts contain  $\perp$  or complementary literals, then no model exists. Otherwise, the formula is satisfiable.
- CNF tells us something as to whether a formula is a tautology. If all clauses (= conjuncts) contain  $\top$  or complementary literals, then the formula is a tautology. Otherwise, the formula is falsifiable.

#### But:

- the transformation into DNF or CNF is expensive (in time/space)
- it is only possible for finite sets of formulas

# **Summary: important notions**

- Syntax: formula, atomic formula, literal, clause
- Semantics: truth value, assignment, interpretation
- Formula satisfied by an interpretation
- Logical implication, entailment
- Satisfiability, validity, tautology, logical equivalence
- Deduction theorem, Contraposition Theorem
- Conjunctive normal form, Disjunctive Normal form, Horn form
