The problem of data integration

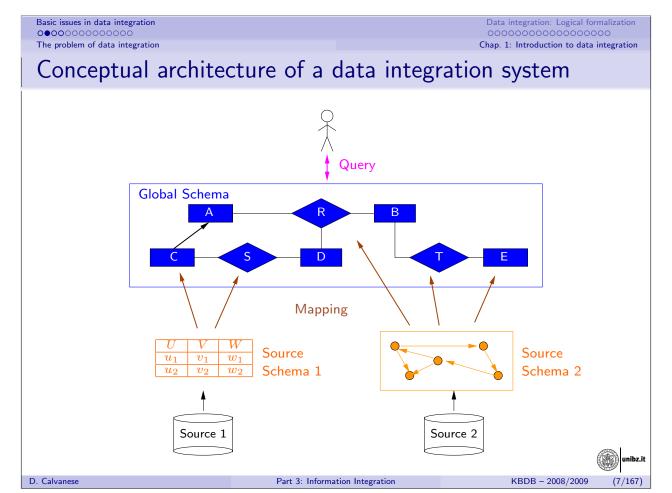

Chap. 1: Introduction to data integration

What is data integration?

Data integration is the problem of providing unified and transparent access to a collection of data stored in **multiple**, **autonomous**, and **heterogeneous** data sources.

Data integration: Logical formalization
00000000000000000000
Chap. 1: Introduction to data integration

Relevance of data integration

- Growing market
- One of the major challenges for the future of IT
- At least two contexts
 - Intra-organization data integration (e.g., EIS)
 - Inter-organization data integration (e.g., integration on the Web)

D. Calvanese Part 3: Information Integration KBDB – 2008/2009

Data integration: Available industrial efforts

- Distributed database systems
- Information on demand
- Tools for source wrapping
- Tools based on database federation, e.g., DB2 Information Integrator
- Distributed query optimization

Architectures for integrated access to distributed data

Distributed databases

Data sources are homogeneous databases under the control of the distributed database management system.

Multidatabase or federated databases

Data sources are autonomous, heterogeneous databases; procedural specification.

(Mediator-based) data integration

Access through a global schema mapped to autonomous and heterogeneous data sources; declarative specification.

Peer-to-peer data integration

Network of autonomous systems mapped one to each other, without a global schema; declarative specification.

D. Calvanese Part 3: Information Integration KBDB – 2008/2009 (10/

Database federation tools: Characteristics

- Physical transparency, i.e., masking from the user the physical characteristics of the sources
- Heterogeinity, i.e., federating highly diverse types of sources
- Extensibility
- Autonomy of data sources
- Performance, through distributed query optimization

However, current tools do not (directly) support **logical** (or conceptual) transparency.

D. Calvanese

Basic issues in data integration

OOOOOOOOOOO

Variants of data integration

Data integration: Logical formalization
00000000000000000000
Chap. 1: Introduction to data integration

Logical transparency

Basic ingredients for achieving logical transparency:

- The global schema (ontology) provides a conceptual view that is independent from the sources.
- The global schema is described with a semantically rich formalism.
- The mappings are the crucial tools for realizing the independence of the global schema from the sources.
- Obviously, the formalism for specifying the mapping is also a crucial point.

All the above aspects are not appropriately dealt with by current tools. This means that data integration cannot be simply addressed on a tool basis.

Approaches to data integration

- (Mediator-based) data integration . . . is the topic of this course
- Data exchange [FKMP05, FKP05]
 - materialization of the global view
 - allows for query answering without accessing the sources
- P2P data integration [HIST03, CDGLR04, CDGL+05]
 - several peers
 - each peer with local and external sources
 - queries over one peer

D. Calvanese

Variants of data integration

Data integration: Logical formalization
00000000000000000000
Chap. 1: Introduction to data integration

Mediator based data integration

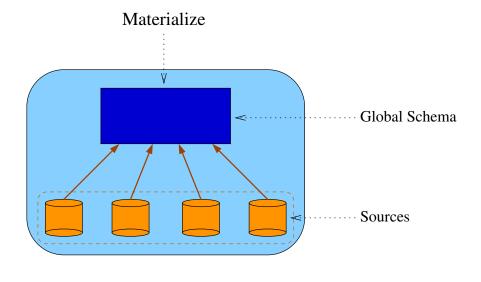

- Queries are expressed over a **global schema** (a.k.a. mediated schema, enterprise model, ...).
- Data are stored in a set of sources.
- Wrappers access the sources (provide a view in a uniform data model of the data stored in the sources).
- Mediators combine answers coming from wrappers and/or other mediators.

Data exchange

• Materialization of the global schema

KBDB - 2008/2009

(17/167)

Data integration: Logical formalization
00000000000000000000
Chap. 1: Introduction to data integration

The modeling problem

Basic questions:

- How to model the global schema:
 - data model
 - constraints
- How to model the sources:
 - data model (conceptual and logical level)
 - access limitations
 - data values (common vs. different domains)
- How to model the mapping between global schemas and sources.
- How to verify the quality of the modeling process.

A word of caution: Data modeling (in data integration) is an art. Theoretical frameworks can help humans, not replace them.

The querying problem

- A query expressed in terms of the global schema must be **reformulated** in terms of (a set of) queries over the sources and/or materialized views.
- The computed sub-queries are shipped to the sources, and the results are collected and assembled into the final answer.
- The computed query plan should guarantee:
 - completeness of the obtained answers wrt the semantics;
 - efficiency of the whole query answering process;
 - efficiency in accessing sources.
- This process heavily depends on the approach adopted for modeling the data integration system.

This is the problem that we want to address in this part of the course.

Formal framework for data integration

Def.: Data integration system \mathcal{I}

A data integration system is a triple $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$, where:

- \mathcal{G} is the global schema i.e., a logical theory over a relational alphabet $\mathcal{A}_{\mathcal{G}}$.
- S is the source schema i.e., simply a relational alphabet A_S disjoint from A_G .
- \mathcal{M} is the mapping between \mathcal{S} and \mathcal{G} .

 We consider different approaches to the specification of mappings.

D. Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(21/167)

Basic issues in data integration

OOOOOOOOOOO

Semantics of a data integration system

Data integration: Logical formalization

○●○○○○○○○○○○○

Chap. 1: Introduction to data integration

Semantics of a data integration system

Which are the dbs that satisfy \mathcal{I} , i.e., the logical models of \mathcal{I} ?

- We refer only to dbs over a **fixed infinite domain** Δ of elements.
- We start from the data present in the sources: these are modeled through a source database \mathcal{D} over Δ (also called source model), fixing the extension of the predicates of $\mathcal{A}_{\mathcal{S}}$.
- The dbs for \mathcal{I} are logical interpretations for $\mathcal{A}_{\mathcal{G}}$, called global dbs.

Def.: Semantics of a data integration system

The set of databases for $\mathcal{A}_{\mathcal{G}}$ that satisfy $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ relative to \mathcal{D} is: $Sem_{\mathcal{I}}(\mathcal{D}) = \{ \mathcal{B} \mid \mathcal{B} \text{ is a global database that is legal wrt } \mathcal{G}$ and that satisfies \mathcal{M} wrt \mathcal{D} $\}$

What it means to satisfy $\mathcal M$ wrt $\mathcal D$ depends on the nature of $\mathcal M$.

D. Calvanese Part 3: Information Integration

KBDB - 2008/2009

(22/167)

Queries to a data integration system ${\mathcal I}$

- The domain Δ is fixed, and we do not distinguish an element of Δ from the constant denoting it \leadsto standard names.
- Queries to \mathcal{I} are relational calculus queries over the alphabet $\mathcal{A}_{\mathcal{G}}$ of the global schema.
- When "evaluating" q over \mathcal{I} , we have to consider that for a given source database \mathcal{D} , there may be many global databases \mathcal{B} in $Sem_{\mathcal{I}}(\mathcal{D})$.
- We consider those answers to q that hold for all global databases in $Sem_{\mathcal{T}}(\mathcal{D}) \rightsquigarrow \mathbf{certain}$ answers.

). Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(23/167)

Basic issues in data integration

OOOOOOOOOOO

Queries to a data integration system

Semantics of queries to ${\mathcal I}$

Def.: Certain answers in a data integration system

Given q, \mathcal{I} , and \mathcal{D} , the set of **certain answers to** q **wrt** \mathcal{I} **and** \mathcal{D} is

$$\operatorname{cert}(q, \mathcal{I}, \mathcal{D}) = \{ (c_1, \dots, c_n) \in q^{\mathcal{B}} \mid \text{for all } \mathcal{B} \in \operatorname{Sem}_{\mathcal{I}}(\mathcal{D}) \}$$

- Query answering is logical implication.
- Complexity is measured mainly wrt the size of the source $db \mathcal{D}$, i.e., we consider data complexity.
- We consider the problem of deciding whether $\vec{c} \in cert(q, \mathcal{I}, \mathcal{D})$, for a given tuple \vec{c} of constants.

Databases with incomplete information, or knowledge bases

- Traditional database: one model of a first-order theory.
 Query answering means evaluating a formula in the model.
- Database with incomplete information, or knowledge base: set of models (specified, for example, as a restricted first-order theory).
 Query answering means computing the tuples that satisfy the query in all the models in the set.

There is a **strong connection** between query answering in data integration and query answering in databases with incomplete information under constraints (or, query answering in knowledge bases).

). Calvanese

- [vdM98]: survey on logical approaches to incomplete information in databases

The mapping

How is the mapping \mathcal{M} between \mathcal{S} and \mathcal{G} specified?

- Are the sources defined in terms of the global schema? Approach called **source-centric**, or **local-as-view**, or **LAV**.
- Is the global schema defined in terms of the sources? Approach called **global-schema-centric**, or **global-as-view**, or **GAV**.
- A mixed approach? Approach called **GLAV**.

Part 3: Information Integration

KBDB - 2008/2009

Basic issues in data integration

Formalizing the mapping

Data integration: Logical formalization Chap. 1: Introduction to data integration

GAV vs. LAV - Example

Global schema:

```
movie(Title, Year, Director)
european(Director)
review( Title, Critique)
```

Source 1:

```
r_1(Title, Year, Director) since 1960, european directors
```

Source 2:

```
r_2(Title, Critique)
                     since 1990
```

```
Query: Title and critique of movies in 1998
```

```
q(t, r) \leftarrow \exists d. \mathsf{movie}(t, 1998, d) \land \mathsf{review}(t, r),
                                                                            in Datalog notation
q(t,r) \leftarrow \mathsf{movie}(t,1998,d), \mathsf{review}(t,r)
```

Formalization of GAV

In GAV (with sound sources), the mapping \mathcal{M} is a set of assertions:

$$\phi_{\mathcal{S}} \rightsquigarrow g$$

one for each element g in $\mathcal{A}_{\mathcal{G}}$, with $\phi_{\mathcal{S}}$ a query over \mathcal{S} of the arity of g.

Given a source db \mathcal{D} , a db \mathcal{B} for \mathcal{G} satisfies \mathcal{M} wrt \mathcal{D} if for each $g \in \mathcal{G}$:

$$\phi_{\mathcal{S}}^{\mathcal{D}} \subseteq g^{\mathcal{B}}$$

In other words, the assertion means: $\forall \vec{x}. \ \phi_{\mathcal{S}}(\vec{x}) \rightarrow g(\vec{x}).$

Given a source database, \mathcal{M} provides direct information about which data satisfy the elements of the global schema.

Relations in G are views, and queries are expressed over the views. Thus, it seems that we can simply evaluate the query over the data satisfying the global relations (as if we had a single db at hand).

). Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(29/167)

Basic issues in data integration

Formalizing GAV data integration systems

Data integration: Logical formalization

OOOOOOOOOOOOOOOOOOOO

Chap. 1: Introduction to data integration

GAV – Example

Global schema: movie(*Title*, *Year*, *Director*)

 $\operatorname{european}(Director)$ $\operatorname{review}(Title, Critique)$

GAV: to each relation in the global schema, \mathcal{M} associates a view over the sources:

$$\begin{array}{lll} q_1(t,y,d) & \leftarrow & \mathsf{r}_1(t,y,d) & \leadsto & \mathsf{movie}(t,y,d) \\ q_2(d) & \leftarrow & \mathsf{r}_1(t,y,d) & \leadsto & \mathsf{european}(d) \\ q_3(t,r) & \leftarrow & \mathsf{r}_2(t,r) & \leadsto & \mathsf{review}(t,r) \end{array}$$

Logical formalization:

$$\forall t, y, d. \ \mathbf{r}_1(t, y, d) \rightarrow \mathsf{movie}(t, y, d) \\ \forall d. \ (\exists t, y. \ \mathbf{r}_1(t, y, d)) \rightarrow \mathsf{european}(d) \\ \forall t, r. \ \mathbf{r}_2(t, r) \rightarrow \mathsf{review}(t, r)$$

GAV - Example of query processing

The query

$$q(t,r) \leftarrow \mathsf{movie}(t,1998,d), \mathsf{review}(t,r)$$

is processed by means of **unfolding**, i.e., by expanding each atom according to its associated definition in \mathcal{M} , so as to come up with source relations.

In this case:

$$\begin{array}{lll} q(t,r) & \leftarrow & \mathsf{movie}(t,1998,d), & \mathsf{review}(t,r) \\ & & \mathsf{unfolding} & \downarrow & \downarrow \\ q(t,r) & \leftarrow & \mathsf{r}_1(t,1998,d), & \mathsf{r}_2(t,r) \end{array}$$

). Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(31/167)

Basic issues in data integration
00000000000
Formalizing GAV data integration systems

GAV - Example of constraints

Global schema containing constraints:

```
\begin{aligned} & \mathsf{movie}(\mathit{Title}, \mathit{Year}, \mathit{Director}) \\ & \mathsf{european}(\mathit{Director}) \\ & \mathsf{review}(\mathit{Title}, \mathit{Critique}) \\ & \mathsf{european\_movie\_60s}(\mathit{Title}, \mathit{Year}, \mathit{Director}) \\ & \forall t, y, d. \, \mathsf{european\_movie\_60s}(t, y, d) \, \rightarrow \, \mathsf{movie}(t, y, d) \\ & \forall d. \, \exists t, y. \, \mathsf{european\_movie\_60s}(t, y, d) \, \rightarrow \, \mathsf{european}(d) \end{aligned}
```

GAV mappings:

$$\begin{array}{lll} q_1(t,y,d) & \leftarrow & \mathsf{r}_1(t,y,d) & \leadsto & \mathsf{european_movie_60s}(t,y,d) \\ q_2(d) & \leftarrow & \mathsf{r}_1(t,y,d) & \leadsto & \mathsf{european}(d) \\ q_3(t,r) & \leftarrow & \mathsf{r}_2(t,r) & \leadsto & \mathsf{review}(t,r) \end{array}$$

Formalization of LAV

In LAV (with sound sources), the mapping \mathcal{M} is a set of assertions:

$$s \sim \phi_{\mathcal{G}}$$

one for each source element s in A_S , with ϕ_G a query over G.

Given a source db \mathcal{D} , a db \mathcal{B} for \mathcal{G} satisfies \mathcal{M} wrt \mathcal{D} if for each $s \in \mathcal{S}$:

$$s^{\mathcal{D}} \subseteq \phi_{\mathcal{G}}^{\mathcal{B}}$$

In other words, the assertion means: $\forall \vec{x} \cdot s(\vec{x}) \rightarrow \phi_{\mathcal{G}}(\vec{x})$.

The mapping \mathcal{M} and the source database \mathcal{D} do **not** provide direct information about which data satisfy the global schema.

Sources are views, and we have to answer queries on the basis of the available data in the views.

D. Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(33/167)

Formalizing LAV data integration systems

LAV - Example

Global schema: movie(*Title*, *Year*, *Director*)

european(Director)review(Title, Critique)

LAV: to each source relation, \mathcal{M} associates a view over the global schema:

$$\begin{array}{lll} \mathbf{r_1}(t,y,d) & \leadsto & q_1(t,y,d) \leftarrow \mathsf{movie}(t,y,d), \ \mathsf{european}(d), \ y \geq 1960 \\ \mathbf{r_2}(t,r) & \leadsto & q_2(t,r) \leftarrow \mathsf{movie}(t,y,d), \ \mathsf{review}(t,r), \ y \geq 1990 \end{array}$$

The query $q(t,r) \leftarrow \mathsf{movie}(t,1998,d)$, $\mathsf{review}(t,r)$ is processed by means of an inference mechanism that aims at re-expressing the atoms of the global schema in terms of atoms at the sources. In this case:

$$q(t,r) \ \leftarrow \ \mathsf{r}_2(t,r), \ \mathsf{r}_1(t,1998,d)$$

GAV and LAV - Comparison

GAV: (e.g., Carnot, SIMS, Tsimmis, IBIS, Momis, Mastro, ...)

- Quality depends on how well we have compiled the sources into the global schema through the mapping.
- Whenever a source changes or a new one is added, the global schema needs to be reconsidered.
- Query processing can be based on some sort of unfolding (query answering looks easier – without constraints).

LAV: (e.g., Information Manifold, DWQ, Picsel)

- Quality depends on how well we have characterized the sources.
- High modularity and extensibility (if the global schema is well designed, when a source changes, only its definition is affected).
- Query processing needs reasoning (query answering complex).

D. Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(35/167)

Basic issues in data integration

OOOOOOOOOOO

Formalizing GLAV data integration systems

Beyond GAV and LAV: GLAV

In GLAV (with sound sources), the mapping \mathcal{M} is a set of assertions:

$$\phi_{\mathcal{S}} \sim \phi_{\mathcal{G}}$$

with $\phi_{\mathcal{S}}$ a query over \mathcal{S} , and $\phi_{\mathcal{G}}$ a query over \mathcal{G} of the same arity as $\phi_{\mathcal{S}}$.

Given a source db \mathcal{D} , a db \mathcal{B} for \mathcal{G} satisfies \mathcal{M} wrt \mathcal{D} if for each $\phi_{\mathcal{S}} \leadsto \phi_{\mathcal{G}}$ in \mathcal{M} :

In other words, the assertion means: $\forall \vec{x} \cdot \phi_{\mathcal{S}}(\vec{x}) \rightarrow \phi_{\mathcal{G}}(\vec{x})$.

As in LAV, the mapping \mathcal{M} does **not** provide direct information about which data satisfy the global schema.

To answer a query q over \mathcal{G} , we have to infer how to use \mathcal{M} in order to access the source database \mathcal{D} .

GLAV - Example

Global schema: work(Person, Project), area(Project, Field)

Source 1: hasjob(Person, Field)

Source 2: teaches(Professor, Course), in(Course, Field) Source 3: get(Researcher, Grant), for(Grant, Project)

GLAV mapping:

$$\begin{array}{lll} q_1^s(r,f) \leftarrow \mathsf{hasjob}(r,f) & \leadsto & q_1^g(r,f) \leftarrow \mathsf{work}(r,p), \ \mathsf{area}(p,f) \\ q_2^s(r,f) \leftarrow \mathsf{teaches}(r,c), \ \mathsf{in}(c,f) & \leadsto & q_2^g(r,f) \leftarrow \mathsf{work}(r,p), \ \mathsf{area}(p,f) \\ q_3^s(r,p) \leftarrow \mathsf{get}(r,g), \ \mathsf{for}(g,p) & \leadsto & q_3^g(r,f) \leftarrow \mathsf{work}(r,p) \} \end{array}$$

Formalizing GLAV data integration systems

Data integration: Logical formalization

○○○○○○○○○○○●

Chap. 1: Introduction to data integration

GLAV - A technical observation

In GLAV (with sound sources), the mapping \mathcal{M} is constituted by a set of assertions:

$$\phi_{\mathcal{S}} \sim \phi_{\mathcal{G}}$$

Each such assertion can be rewritten wlog by introducing a **new predicate** r of the same arity as the two queries and replace the assertion with the following two:

$$\phi_{\mathcal{S}} \sim r \qquad r \sim \phi_{\mathcal{G}}$$

In other words, we replace
$$\forall \vec{x}. \phi_{\mathcal{S}}(\vec{x}) \rightarrow \phi_{\mathcal{G}}(\vec{x})$$
 with $\forall \vec{x}. \phi_{\mathcal{S}}(\vec{x}) \rightarrow r(\vec{x})$ and $\forall \vec{x}. r(\vec{x}) \rightarrow \phi_{\mathcal{G}}(\vec{x})$

Note: The new relations r can considered to be part of \mathcal{G} (but should not appear in user queries). Hence, $\phi_{\mathcal{S}} \rightsquigarrow r$ is like a GAV mapping assertion, while $r \rightsquigarrow \phi_{\mathcal{G}}$ is a form of constraint on \mathcal{G} .

Chap. 2: Query answering without constraints

Outline

Query answering

- Query answering in GAV without constraints
- 4 Query answering in (G)LAV without constraints

Query answering in different approaches

The problem of query answering comes in different forms, depending on several parameters:

- Global schema
 - without constraints (i.e., empty theory)
 - with constraints
- Mapping
 - GAV
 - LAV (or GLAV)
- Queries
 - user queries
 - queries in the mapping

D. Calvanese

Part 3: Information Integration

KBDB - 2008/2009

(41/107)

Query answering

QA in GAV without constraints

QA in (G)LAV without constraints

Chap. 2: Query answering without constraints

Conjunctive queries

We recall the following definition:

Def.: A conjunctive query (CQ) is a query of the form

$$q(\vec{x}) \leftarrow \exists \vec{y}. \ r_1(\vec{x}_1, \vec{y}_1) \wedge \cdots \wedge r_m(\vec{x}_m, \vec{y}_m)$$

where

- \vec{x} is the union of the \vec{x}_i 's, called the distinguished variables;
- ullet $ec{y}$ is the union of the $ec{y}_i$'s, called the non-distinguished variables;
- r_1, \ldots, r_m are relation symbols (not built-in predicates).

Unless otherwise specified, we consider conjunctive queries, both as user queries and as queries in the mapping.

Incompleteness and inconsistency

Query answering heavily depends upon whether incompleteness/inconsistency shows up:

Constraints in \mathcal{G}	Type of mapping	Incompleteness	Inconsistency
no	GAV	yes / no	no
no	(G)LAV	yes	no
yes	GAV	yes	yes
yes	(G)LAV	yes	yes

GAV - Retrieved global database

Def.: Retrieved global database

Given a source database \mathcal{D} , we call **retrieved global database**, denoted $\mathcal{M}(\mathcal{D})$, the global database obtained by "applying" the queries in the mapping, and "transferring" to the elements of \mathcal{G} the corresponding retrieved tuples.

GAV - Example

Consider $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$, with

Global schema G: student(Code, Name, City)

university(Code, Name) enrolled(Scode, Ucode)

Source schema S: relations $s_1(Scode, Sname, City, Age)$,

 $s_2(\mathit{Ucode}, \mathit{Uname}), \quad s_3(\mathit{Scode}, \mathit{Ucode})$

Mapping \mathcal{M} :

$$\begin{array}{lll} q_1(c,n,ci) & \leftarrow \ \mathsf{s}_1(c,n,ci,a) & \leadsto & \mathsf{student}(c,n,ci) \\ q_2(c,n) & \leftarrow \ \mathsf{s}_2(c,n) & \leadsto & \mathsf{university}(c,n) \\ q_3(s,u) & \leftarrow \ \mathsf{s}_3(s,u) & \leadsto & \mathsf{enrolled}(s,u) \end{array}$$

Example of source database \mathcal{D} and corresponding retrieved global database $\mathcal{M}(\mathcal{D})$.

GAV - Minimal model

GAV mapping assertions $\phi_{\mathcal{S}} \sim g$ have the logical form:

$$\forall \vec{x}. \ \phi_{\mathcal{S}}(\vec{x}) \rightarrow g(\vec{x})$$

where ϕ_S is a conjunctive query over the source relations, and g is an element of \mathcal{G} .

In general, given a source database \mathcal{D} , there are several databases legal wrt \mathcal{G} that satisfy \mathcal{M} wrt \mathcal{D} .

However, it is easy to see that $\mathcal{M}(\mathcal{D})$ is the intersection of all such databases, and therefore, is the **unique "minimal" model** of \mathcal{I} .

Query answering via unfolding

GAV - Query answering via unfolding

The **unfolding wrt** \mathcal{M} of a query q over \mathcal{G} : is the query obtained from q by substituting every symbol g in q with the query $\phi_{\mathcal{S}}$ that \mathcal{M} associates to g. We denote the unfolding of q wrt \mathcal{M} with $\mathbf{unf}_{\mathcal{M}}(q)$.

Observations:

- Since $\mathcal{M}(\mathcal{D})$ is the unique minimal model of \mathcal{I} , if q is a CQ or an UCQ, then $\vec{c} \in cert(q, \mathcal{I}, \mathcal{D})$ iff $\vec{c} \in q^{\mathcal{M}(\mathcal{D})}$.
- $unf_{\mathcal{M}}(q)$ is a query expressed over the source schema \mathcal{S} .
- Evaluating q over $\mathcal{M}(\mathcal{D})$ is equiv. to evaluating $\mathit{unf}_{\mathcal{M}}(q)$ over \mathcal{D} , i.e., $\vec{c} \in q^{\mathcal{M}(\mathcal{D})}$ iff $\vec{c} \in \mathit{unf}_{\mathcal{M}}(q)^{\mathcal{D}}$.
- $\begin{array}{lll} \bullet & \text{Hence,} & \vec{c} \in cert(q,\mathcal{I},\mathcal{D}) & \text{iff} & \vec{c} \in q^{\mathcal{M}(\mathcal{D})} & \text{iff} & \vec{c} \in \textit{unf}_{\mathcal{M}}(q)^{\mathcal{D}}. \\ & \sim & \text{Unfolding suffices for query answering in GAV without constraints.} \end{array}$

Scode	Ucode	
12	x	
15	y	

A source db \mathcal{D} and a corresponding possible global db.

(G)LAV – Incompleteness

(G)LAV mapping assertions $\phi_{\mathcal{S}} \rightsquigarrow \phi_{\mathcal{G}}$ have the logical form:

$$\forall \vec{x}. \ \phi_{\mathcal{S}}(\vec{x}) \rightarrow \exists \vec{y}. \ \phi_{\mathcal{G}}(\vec{x}, \vec{y})$$

where ϕ_S and $\phi_{\mathcal{G}}$ are conjunctions of atoms.

Given a source database \mathcal{D} , in general there are several solutions for a set of (G)LAV assertions (i.e., different databases that are legal wrt \mathcal{G} that satisfy \mathcal{M} wrt \mathcal{D}).

→ Incompleteness comes from the mapping.

This holds even for the case of very simple queries $\phi_{\mathcal{G}}$:

$$s_1(x) \rightsquigarrow q(x) \leftarrow \exists y. \ g(x,y)$$

(G)LAV - Query answering is based on logical inference

Approaches to query answering in (G)LAV

(G)LAV - Approaches to query answering

- Exploit connection with guery containment.
- Direct methods (aka view-based query answering): Try to answer directly the query by means of an algorithm that takes as input the user query q, the specification of \mathcal{I} , and the source database \mathcal{D} .
- By (view-based) query rewriting:
 - ① Taking into account \mathcal{I} , reformulate the user query q as a new query (called a rewriting of q) over the source relations.
 - 2 Evaluate the rewriting over the source database \mathcal{D} .

Note: In (G)LAV data integration the views are the sources.

QA in GAV without constraints

QA in (G)LAV without constraints

Chap. 2: Query answering without constraints

Approaches to query answering in (G)LAV

Connection between query answering and containment

Def.: Query containment (under a set of constraints Σ)

is the problem of checking, given two queries q_1 , q_2 of the same arity, whether $q_1^{\mathcal{D}}$ is contained in $q_2^{\mathcal{D}}$ for every database \mathcal{D} (satisfying the constraints Σ).

Query answering can be rephrased in terms of query containment:

- A source database \mathcal{D} can be represented as a conjunction $q_{\mathcal{D}}$ of ground literals over $\mathcal{A}_{\mathcal{S}}$ (e.g., if $\vec{c} \in s^{\mathcal{D}}$, there is a literal $s(\vec{c})$).
- If q is a query, and \vec{c} is a tuple, then we denote by $q_{\vec{c}}$ the query obtained by substituting the free variables of q with \vec{c} .
- The problem of checking whether $\vec{c} \in cert(q, \mathcal{I}, \mathcal{D})$ under sound sources can be reduced to the problem of checking whether the conjunctive query $q_{\mathcal{D}}$ is contained in $q_{\vec{c}}$ under the constraints expressed by $\mathcal{G} \cup \mathcal{M}$.

D. Calvanese Part 3: Information Integration KBDB - 2008/2009 (62/167

Query answering via query containment

Complexity of checking certain answers under sound sources:

- The **combined complexity** is identical to the complexity of query containment under constraints.
- The data complexity is the complexity of query containment under constraints when the right-hand side query is considered fixed.
 Hence, it is at most the complexity of query containment under constraints.

It follows that most results and techniques for query containment (under constraints) are relevant also for query answering (under constraints).

Note: Also, query containment can be reduced to query answering. However, (in the presence of constraints) we need to allow for constants of the database to denote the same object (unique name assumption does not hold).

(G)LAV – Canonical model

Def.: Canonical retrieved global database for $\mathcal I$ relative to $\mathcal D$

Such a database, denoted $Can_{\mathcal{I}}(\mathcal{D})$ (also called **canonical model of** \mathcal{I} **relative to** \mathcal{D}), is constructed as follows:

- Let all predicates initially be empty in $Can_{\mathcal{I}}(\mathcal{D})$.
- ullet For each mapping assertion $\phi_{\mathcal{S}} \leadsto \phi_{\mathcal{G}}$ in \mathcal{M}
 - for each tuple $\vec{c} \in \phi_{\mathcal{S}}^{\mathcal{D}}$ such that $\vec{c} \not\in \phi_{\mathcal{G}}^{Can_{\mathcal{I}}(\mathcal{D})}$, add \vec{c} to $\phi_{\mathcal{G}}^{Can_{\mathcal{I}}(\mathcal{D})}$ by inventing fresh variables (Skolem terms) in order to satisfy the existentially quantified variables in $\phi_{\mathcal{G}}$.

Properties of $Can_{\mathcal{I}}(\mathcal{D})$:

- Unique up to variable renaming.
- ullet Can be computed in polynomial time wrt the size of \mathcal{D} .
- Satisfies \mathcal{M} by construction, and obviously satisfies \mathcal{G} (since there are no constraints). Hence, $Can_{\mathcal{I}}(\mathcal{D}) \in Sem_{\mathcal{I}}(\mathcal{D})$.

(G)LAV - Universal solution

Let $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ be a data integration system, and \mathcal{D} a source db.

Def.: Universal solution for \mathcal{I} relative to \mathcal{D}

Is a global db \mathcal{B} that satisfies \mathcal{I} relative to \mathcal{D} and such that, for every global db \mathcal{B}' that satisfies \mathcal{I} relative to \mathcal{D} , there exists a homomorphism $h: \mathcal{B} \to \mathcal{B}'$ (see [FKMP05]).

Theorem

Let $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ be a (G)LAV data integration system without constraints in the global schema, and \mathcal{D} a source database. Then $Can_{\mathcal{I}}(\mathcal{D})$ is a **universal** solution for \mathcal{I} relative to \mathcal{D} (follows from [FKMP05]).

Query answering

QA in GAV without constraints

QA in (G)LAV without constraints

(G)LAV: Direct methods (aka view-based query answering)

Chap. 2: Query answering without constraints

(G)LAV – Query answering

Theorem

Let $\mathcal{I}=\langle\mathcal{G},\mathcal{S},\mathcal{M}\rangle$ be a (G)LAV data integration system without constraints in the global schema, \mathcal{D} a source database, and q a conjunctive query. Then $\vec{c}\in cert(q,\mathcal{I},\mathcal{D})$ iff $\vec{c}\in q^{Can_{\mathcal{I}}(\mathcal{D})}$.

Proof.

" \Rightarrow " Trivial, since $Can_{\mathcal{I}}(\mathcal{D}) \in Sem_{\mathcal{I}}(\mathcal{D})$.

"\(\Lefta \)" Consider a global db $\mathcal{B} \in Sem_{\mathcal{I}}(\mathcal{D})$.

- Since $\vec{c} \in q^{Can_{\mathcal{I}}(\mathcal{D})}$, there exists a homomorphism $h_1: q(\vec{c}) \to Can_{\mathcal{I}}(\mathcal{D})$.
- Since $Can_{\mathcal{I}}(\mathcal{D})$ is a universal solution, there exists a homomorphism $h_2: Can_{\mathcal{I}}(\mathcal{D}) \to \mathcal{B}$.

Hence, $h_1 \circ h_2$ is a homomorphism from $q(\vec{c})$ to \mathcal{B} , and $\vec{c} \in q^{\mathcal{B}}$.

(G)LAV - Complexity of query answering

From the above results, we obtain that for a CQ q, we can compute $cert(q, \mathcal{I}, \mathcal{D})$ as follows:

- **1** Compute $Can_{\mathcal{I}}(\mathcal{D})$ from \mathcal{D} polynomial in $|\mathcal{D}|$.
- ② Evaluate q over $Can_{\mathcal{I}}(\mathcal{D})$ LogSpace in $|\mathcal{D}|$.

The above applies also to UCQs. Hence, we obtain the following result.

Theorem

In a (G)LAV data integration system without constraints, answering unions of conjunctive queries is **polynomial in data and combined complexity**.

The data complexity upper bound can actually be improved.

). Calvanese

Query answering QA in GAV without constraints

OOO OOOOOOO

(G)LAV: Direct methods (aka view-based query answering)

(G)LAV – "Inverse rules" technique

From [DG97]: consider mappings as "inverse" rules:

```
\begin{array}{lll} \mathbf{r_1}(t) & \leadsto & q_1(t) \leftarrow \mathsf{movie}(t,y,d) \land \mathsf{european}(d) \\ \mathbf{r_2}(t,v) & \leadsto & q_2(t,v) \leftarrow \mathsf{movie}(t,y,d) \land \mathsf{review}(t,v) \\ & \forall t. \ \mathsf{r_1}(t) \rightarrow \exists y,d. \ \mathsf{movie}(t,y,d) \land \mathsf{european}(d) \\ & \forall t,v. \ \mathsf{r_2}(t,v) \rightarrow \exists y,d. \ \mathsf{movie}(t,y,d) \land \mathsf{review}(t,v) \\ & & \mathsf{movie}(t,f_1(t),f_2(t)) \leftarrow \mathsf{r_1}(t) \\ & & \mathsf{european}(f_2(t)) \leftarrow \mathsf{r_1}(t) \\ & & \mathsf{movie}(t,f_4(t,v),f_5(t,v)) \leftarrow \mathsf{r_2}(t,v) \\ & & \mathsf{review}(t,v) \leftarrow \mathsf{r_2}(t,v) \end{array}
```

Answering a query means evaluating a goal wrt to this nonrecursive logic program (which can be transformed into a union of CQs).

Theorem

In a (G)LAV data integration system without constraints, answering unions of conjunctive queries is LogSpace in data complexity.

unibz.it

(G)LAV – More expressive queries?

- More expressive source queries in the mapping?
 - Same results hold if we use **any computable query** as source query in the mapping assertions.
- More expressive queries over the global schema in the mapping?
 - Already unions of conjunctive queries lead to intractability.
- More expressive user queries?
 - Same results hold if we use **Datalog queries** as user queries.
 - Even the simplest form of negation (inequalities) leads to intractability.

OOO OOOOOO

(G)LAV: Direct methods (aka view-based query answering)

QA in (G)LAV without constraints

d query answering) Chap. 2: Query answering without constraints

(G)LAV - Intractability for views that contain union

From [vdM93], by reduction from 3-colorability.

We define the following LAV data integration system $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$:

```
\mathcal{G}: \operatorname{edge}(x,y), \operatorname{color}(x,c) \mathcal{S}: \operatorname{s}_{E}(x,y), \operatorname{s}_{N}(x) \mathcal{M}: \operatorname{s}_{E}(x,y) \leadsto q_{E}(x,y) \leftarrow \operatorname{edge}(x,y) \operatorname{s}_{N}(x) \leadsto q_{N}(x) \leftarrow \operatorname{color}(x,\operatorname{RED}) \vee \operatorname{color}(x,\operatorname{BLUE}) \vee \operatorname{color}(x,\operatorname{GREEN})
```

Given a graph G=(N,E), we define the following source database \mathcal{D} :

```
s_E^{\mathcal{D}} = \{ (a, b), (b, a) \mid (a, b) \in E \} s_N^{\mathcal{D}} = \{ (a) \mid a \in N \}
```

Consider the boolean query: $q() \leftarrow \exists x, y, c. \, \mathsf{edge}(x, y) \land \mathsf{color}(x, c) \land \mathsf{color}(y, c)$ describing mismatched edge pairs:

- If G is 3-colorable, then $\exists \mathcal{B} \text{ s.t. } q^{\mathcal{B}} = false$, hence $cert(q, \mathcal{I}, \mathcal{D}) = false$.
- If G is not 3-colorable, then $cert(q, \mathcal{I}, \mathcal{D}) = true$.

Theorem

In a LAV data integration system without constraints and with UCQs as views, answering CQs is coNP-hard in data complexity.

(G)LAV - In coNP for views and queries that are UCQs

- $\vec{c} \not\in cert(q, \mathcal{I}, \mathcal{D})$ if and only if there is a database \mathcal{B} for \mathcal{I} that satisfies \mathcal{M} wrt \mathcal{D} , and such that $\vec{c} \not\in q^{\mathcal{B}}$.
- The mapping \mathcal{M} has the form:

$$\forall \vec{x}. \phi_{\mathcal{S}}(\vec{x}) \rightarrow \exists \vec{y}_1. \alpha_1(\vec{x}, \vec{y}_1) \lor \cdots \lor \exists \vec{y}_h \alpha_h(\vec{x}, \vec{y}_h))$$

Hence, each tuple in \mathcal{D} forces the existence of k tuples in any database that satisfies \mathcal{M} wrt \mathcal{D} , where k is the maximal length of conjunctions $\alpha_i(\vec{x}, \vec{y_i})$ in \mathcal{M} .

- If \mathcal{D} has n tuples, then there is a db $\mathcal{B}'\subseteq\mathcal{B}$ for \mathcal{I} that satisfies \mathcal{M} wrt \mathcal{D} with at most $n\cdot k$ tuples. Since q is monotone, $\vec{c}\not\in q^{\mathcal{B}'}$.
- Checking whether \mathcal{B}' satisfies \mathcal{M} wrt \mathcal{D} , and checking whether $\vec{c} \notin q^{\mathcal{B}'}$ can be done in PTIME wrt the size of \mathcal{B}' .

Theorem

In a LAV data integration system without constraints and with UCQs as views, answering UCQs is coNP-complete in data complexity.

Query answering

QA in GAV without constraints

QA in (G)LAV without constraints

(G)LAV: Direct methods (aka view-based query answering)

Chap. 2: Query answering without constraints

(G)LAV – Conjunctive user queries with inequalities

Consider $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$, and source db \mathcal{D} (see [FKMP05]):

 $\begin{array}{ll} \mathcal{G}: & g(x,y) & \mathcal{S}: \ s(x,y) \\ \mathcal{M}: & s(x,y) \leadsto \ q(x,y) \leftarrow g(x,z) \land g(z,y) \\ \mathcal{D}: & \{\ s(\mathtt{a},\mathtt{a})\ \} \end{array}$

- Both $\mathcal{B}_1 = \{g(\mathtt{a},\mathtt{a})\}$ and $\mathcal{B}_2 = \{g(\mathtt{a},\mathtt{b}), \ g(\mathtt{b},\mathtt{a})\}$ are solutions.
- If \mathcal{B} is a universal solution, then both $g(\mathbf{a}, x)$ and $g(x, \mathbf{a})$ are in \mathcal{B} , with $x \neq \mathbf{a}$ (otherwise $g(\mathbf{a}, \mathbf{a})$ would be true in every solution).

Let $q() \leftarrow g(x,y) \land x \neq y$

- $\bullet \ q^{\mathcal{B}_1} = \mathit{false} \text{, hence } \mathit{cert}(q, \mathcal{I}, \mathcal{D}) = \mathit{false}.$
- But $q^{\mathcal{B}} = true$ for every universal solution \mathcal{B} for \mathcal{I} relative to \mathcal{D} .

Hence, the notion of universal solution is not the right tool.

(G)LAV - Conjunctive user queries with inequalities

- coNP algorithm: guess equalities on variables in the canonical retrieved global database.
- coNP-hard already for a conjunctive user query with one inequality (and conjunctive view definitions) [AD98].

Theorem

In a (G)LAV data integration system without constraints and with CQs as views, answering CQs with inequalities is coNP-complete in data complexity.

Note: inequalities in the view definitions do not affect expressive power and complexity (in fact, they can be removed).

Query answering

(G)LAV: Query answering by (view-based) query rewriting

In the presence of incomplete information, as is the case in (G)LAV data integration, query answering is a form of logical inference.

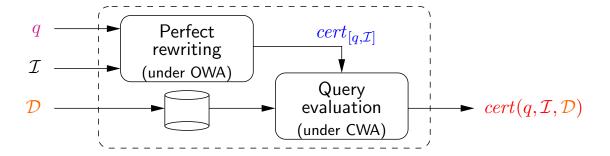

QA in GAV without constraints

Query answering: perfect rewriting + evaluation

We can (at least conceptually) separate the contribution of the query, global schema, and mappings from the contribution of the data.

The query $cert_{[q,\mathcal{I}]}$ that is the result of the perfect rewriting could be expressed in an **arbitrary query language**.

). Calvanese

Part 3: Information Integration

QA in GAV without constraints

KBDB - 2008/2009

(77/167)

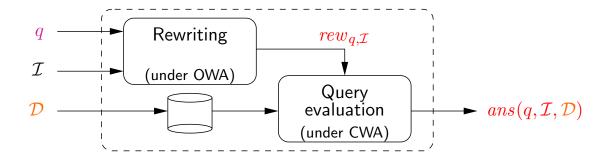

(G)LAV: Query answering by (view-based) query rewriting

QA in (G)LAV without constraints

Chap. 2: Query answering without constraints

Query answering: rewriting + evaluation

In practice, we can divide query answering in two steps by chosing a priori the language of the rewriting $rew_{q,\mathcal{I}}$:

- Rewrite the query in terms of the **chosen query language** over the alphabet of A_S .
- f 2 Evaluate the rewriting over the source database $\cal D$.

(G)LAV – Maximal rewritings

Query answering by rewriting:

- Given $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ and a query q over \mathcal{G} , rewrite q into a query, called $rew_{q,\mathcal{I}}$, over the alphabet $\mathcal{A}_{\mathcal{S}}$ of the sources.
- ② Evaluate the rewriting $rew_{q,\mathcal{I}}$ over the source database \mathcal{D} .

Def.: **Maximal** \mathcal{L} -rewriting of q wrt \mathcal{I}

Given $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$, a query q over \mathcal{G} , and a query language \mathcal{L} , a maximal \mathcal{L} -rewriting of q wrt \mathcal{I} is a query that:

- is expressed in \mathcal{L} ;
- is sound, i.e., for every db \mathcal{D} computes only tuples in $cert(q, \mathcal{I}, \mathcal{D})$;
- is the maximal such query among those expressible in \mathcal{L} .

We are interested in computing maximal \mathcal{L} -rewritings.

). Calvanese

Part 3: Information Integration

QA in GAV without constraints

KBDB - 2008/2009

QA in (G)LAV without constraints

(79/167)

(G)LAV: Query answering by (view-based) query rewriting Chap. 2: Query answering without constraints $(G)LAV - Example \ of \ maximal \ rewriting$

```
\mathcal{G}: nonstop(Airline, Num, From, To)
```

 \mathcal{S} : flightsByUnited(Num, From, To) flightsFromSFO(Airline, Num, To)

```
\mathcal{M}: flightsByUnited(num, from, to) \rightarrow
```

 $g_1(num, from, to) \leftarrow \mathsf{nonstop}(\mathtt{UA}, num, from, to)$ flightsFromSFO(airline, num, to) \leadsto $g_2(airline, num, to) \leftarrow \mathsf{nonstop}(airline, num, \mathtt{SFO}, to)$

Queries: $q_1(al, num) \leftarrow \mathsf{nonstop}(al, num, \texttt{LAX}, \texttt{PHX})$

Queries: $q_1(al, num) \leftarrow \mathsf{nonstop}(al, num, \mathsf{LAX}, \mathsf{PHX})$ $q_2(al, num) \leftarrow \mathsf{nonstop}(al, num, \mathsf{SFO}, to)$

Maximal (wrt positive queries) rewritings of q_1 and q_2 are:

```
\begin{array}{lll} rew_{q_1,\mathcal{I}}(al,num) & \leftarrow & \mathsf{flightsByUnited}(num,\mathtt{LAX},\mathtt{PHX}), \ al = \mathtt{UA} \\ rew_{q_2,\mathcal{I}}(al,num) & \leftarrow & \mathsf{flightsByUnited}(num,\mathtt{SFO},to), \ al = \mathtt{UA} \ \lor \\ & & \mathsf{flightsFromSFO}(al,num,to) \end{array}
```

(G)LAV – Exact rewritings

The (mappings in) a data integration system and the choice of $\mathcal L$ may be such that even a maximal \mathcal{L} -rewriting does **not** provide all answers that the query evaluated over a global db would provide.

Def.: Exact rewriting

An exact rewriting of a query q wrt a data integration system $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ is a rewriting that is logically equivalent to q, modulo the mappings \mathcal{M} .

Note: exact rewritings may not exist for a given query.

Example (from the previous slide)

- $rew_{q_1,\mathcal{I}}$ is not an exact rewriting of q_1 wrt \mathcal{I} .
- $rew_{q_2,\mathcal{I}}$ is an exact rewriting of q_2 wrt \mathcal{I} .

KBDB - 2008/2009

QA in GAV without constraints (G)LAV: Query answering by (view-based) query rewriting

QA in (G)LAV without constraints Chap. 2: Query answering without constraints

Perfect rewriting

What is the relationship between answering by rewriting and certain answers? [CDGLV05]:

- When does the (maximal) rewriting compute all certain answers?
- What do we gain or loose by focusing on a given class of queries?

Let's try to consider the "best possible" rewriting.

Define $cert_{[q,\mathcal{I}]}(\cdot)$ to be the function that, with q and \mathcal{I} fixed, given source database \mathcal{D} , computes the certain answers $cert(q, \mathcal{I}, \mathcal{D})$.

- $cert_{[q,\mathcal{I}]}$ can be seen as a query on the alphabet $\mathcal{A}_{\mathcal{S}}$.
- $cert_{[q,\mathcal{I}]}$ is a (sound) rewriting of q wrt \mathcal{I} .
- No sound rewriting exists that is better than $cert_{[q,\mathcal{I}]}$.

Hence, $cert_{[q,\mathcal{I}]}$ is called the **perfect rewriting** of q wrt \mathcal{I} .

KBDB - 2008/2009 D. Calvanese Part 3: Information Integration

Properties of the perfect rewriting

- Can the perfect rewriting be expressed in a certain query language?
- For a given class of queries, what is the relationship between a maximal rewriting and the perfect rewriting?
 - From a semantical point of view
 - From a computational point of view
- Which is the computational complexity of finding the perfect rewriting, and how big is it?
- Which is the computational complexity of evaluating the perfect rewriting?

(G)LAV: Query answering by (view-based) query rewriting

QA in (G)LAV without constraints

Chap. 2: Query answering without constraints

(G)LAV – The case of conjunctive queries

Theorem ([LMSS95, AD98])

Let $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ be a (G)LAV data integration system where the queries in \mathcal{M} are CQs. Let q be a CQ and let q' be the union of all maximal rewritings of q for the class of CQs. Then:

- q' is the maximal rewriting for the class of unions of conjunctive queries (UCQs).
- q' is the perfect rewriting of q wrt \mathcal{I} .
- ullet q' is a PTIME query.
- q' is an exact rewriting (equivalent to q for each database \mathcal{B} of \mathcal{I}), if an exact rewriting exists.

Does this "ideal situation" carry over to cases where q and \mathcal{M} allow for union?

D. Calvanese Part 3: Information Integration KBDB - 2008/2009 (84/167)

(G)LAV - The case of mappings with union

When queries over the global schema in the mapping contain union:

- We have seen that view-based query answering is coNP-complete in data complexity [vdM93].
- Hence, $cert(q, \mathcal{I}, \mathcal{D})$, with q, \mathcal{I} fixed, is a coNP-complete function.
- ullet Hence, the perfect rewriting $cert_{[q,\mathcal{I}]}$ is a coNP-complete query.

We do not have the ideal situation we had for conjunctive queries.

Problem:

Isolate those cases of view based query rewriting for data integration systems ${\mathcal I}$ where mappings contain unions for which the perfect rewriting $cert_{[q,\mathcal{I}]}$ is a PTIME function (assuming $P \neq NP$) [CDGLV00c].

Global integrity constraints

- Integrity constraints (ICs) are posed over the global schema.
- Specify intensional knowledge about the domain of interest.
- Add semantics to the information.
- But data in the sources can conflict with global ICs.
- The presence of global ICs raises semantic and computational problems.

Note: global integrity constraints play the same role as an ontology in Ontology-Based Data Access.

KBDB - 2008/2009

Global integrity constraints 00000 Types of integrity constraints Query answering in GAV with constraints

Chap. 3: Query answering with constraints

Integrity constraints for relational schemas

Most important types of ICs that have been considered for the relational model:

- key dependencies (KDs)
- functional dependencies (FDs)
- foreign keys (FKs)
- inclusion dependencies (IDs)
- exclusion dependencies (EDs)

KBDB - 2008/2009 D. Calvanese Part 3: Information Integration

Syntax and semantics of integrity constraints

We present now the syntax and semantics of the various types of integrity constraints, concentrating on KDs, IDs, and EDs.

To define their semantics, we specify when a database \mathcal{D} satisfies a constraint C, denoted $\mathcal{D} \models C$.

We make use the following notation: let r be a relation symbol of arity n and let i_1, \ldots, i_k be components of r:

- ullet $r^{\mathcal{D}}[i_1,\ldots,i_k]$ denotes the projection of relation $r^{\mathcal{D}}$ on the components i_1,\ldots,i_k .
- ullet Given a tuple $t \in r^{\mathcal{D}}$, we have that $t[i_1, \dots, i_k]$ denotes the tuple constituted by the components i_1, \ldots, i_k of t.

Global integrity constraints 000000 Types of integrity constraints

Inclusion dependencies (IDs)

An inclusion dependency (ID) states that the presence of a tuple \vec{t}_1 in a relation implies the presence of a tuple $ec{t}_2$ in another relation, where $ec{t}_2$ contains a projection of the values contained in \vec{t}_1 .

Def.: Syntax of inclusion dependencies:

$$r[i_1,\ldots,i_k]\subseteq s[j_1,\ldots,j_k]$$

with i_1, \ldots, i_k components of r, and j_1, \ldots, j_k components of s.

Semantics: $\mathcal{D} \models r[i_1, \dots, i_k] \subseteq s[j_1, \dots, j_k]$ if $r^{\mathcal{D}}[i_1, \dots, i_k] \subseteq s^{\mathcal{D}}[j_1, \dots, j_k]$.

Example

For r of arity 3 and s of arity 2, the ID $r[1] \subseteq s[2]$ corresponds to the FOL sentence:

$$\forall x, y, w. \ r(x, y, w) \rightarrow \exists z. \ s(z, x)$$

Note: IDs are a special form of tuple-generating dependencies.

Key dependencies (KDs)

A key dependency (KD) states that a set of attributes functionally determines all the attributes of a relation.

Def.: Syntax of key dependencies:

$$key(r) = \{i_1, \dots, i_k\}$$

with i_1, \ldots, i_k components of r.

Semantics: $\mathcal{D} \models \textit{key}(r) = \{i_1, \dots, i_k\}$ if for all $t_1, t_2 \in r^{\mathcal{D}}$, we have that $t_1[i_1,\ldots,i_k] = t_2[i_1,\ldots,i_k]$ implies $t_1 = t_2$.

Example

For r of arity 3, the KD $key(r) = \{1\}$ corresponds to the FOL sentence

$$\forall x, y, y', z, z'$$
. $r(x, y, z) \land r(x, y', z') \rightarrow y = y' \land z = z'$

Note: KDs are a special form of equality-generating dependencies.

Part 3: Information Integration

Global integrity constraints 00000 Types of integrity constraints

Exclusion dependencies (EDs)

An exclusion dependency (ED) states that the presence of a tuple \vec{t}_1 in a relation implies the absence of a tuple \vec{t}_2 in another relation, where \vec{t}_2 contains a projection of the values contained in \vec{t}_1 .

Def.: Syntax of exclusion dependencies:

$$r[i_1,\ldots,i_k]\cap s[j_1,\ldots,j_k]=\emptyset$$

with i_1, \ldots, i_k components of r, and j_1, \ldots, j_k components of s.

Sem.:
$$\mathcal{D} \models r[i_1, \dots, i_k] \cap s[j_1, \dots, j_k] = \emptyset$$
 if $r^{\mathcal{D}}[i_1, \dots, i_k] \cap s^{\mathcal{D}}[j_1, \dots, j_k] = \emptyset$.

Example

For r of arity 3 and s of arity 2, the ED $r[1] \cap s[2] = \emptyset$ corresponds to the FOL sentence

$$\forall x,y,w,z.\ r(x,y,w) \rightarrow \neg s(z,x)$$

Note: EDs are a special form of denial constraints.

Global integrity constraints

Query answering in GAV with constraints

Incompleteness and inconsistency in GAV systems

Chap. 3: Query answering with constraints

GAV system with integrity constraints

We consider a data integration system $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ where:

- *G* is a global schema with constraints.
- \mathcal{M} is a set of GAV mappings, whose assertions have the form $\phi_{\mathcal{S}} \sim g$ and are interpreted as

$$\forall \vec{x} \cdot \phi_{\mathcal{S}}(\vec{x}) \to g(\vec{x}),$$

where $\phi_{\mathcal{S}}$ is a conjunctive query over \mathcal{S} , and g is an element of \mathcal{G} .

Basic observation: Since \mathcal{G} does have constraints, the retrieved global database $\mathcal{M}(\mathcal{D})$ may not be legal for \mathcal{G} .

Semantics of GAV systems with integrity constraints

Given a source db \mathcal{D} , a global db \mathcal{B} (over Δ) satisfies \mathcal{I} relative to \mathcal{D} if:

- It is legal wrt the global schema, i.e., it satisfies the ICs.
- $oldsymbol{\circ}$ It satisfies the mapping, i.e., \mathcal{B} is a superset of the retrieved global database $\mathcal{M}(\mathcal{D})$ (sound mappings).

Recall:

- $\mathcal{M}(\mathcal{D})$ is obtained by evaluating, for each relation in $\mathcal{A}_{\mathcal{G}}$, the corresponding mapping query over the source database \mathcal{D} .
- We are interested in certain answers to a query, i.e., those that hold for all global databases that satisfy \mathcal{I} relative to \mathcal{D} .

KBDB - 2008/2009

Global integrity constraints

Query answering in GAV with constraints

Incompleteness and inconsistency in GAV systems

Chap. 3: Query answering with constraints

GAV with constraints – Example

```
Consider \mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle, with:
```

```
\mathsf{student}(\mathit{Code}, \mathit{Name}, \mathit{City})
                                     key(student) = \{Code\}
university(Code, Name)
                                     key(university) = \{Code\}
enrolled(Scode, Ucode)
                                     enrolled[Scode] \subseteq student[Code]
                                     enrolled[Ucode] \subseteq university[Code]
```

```
Source schema S: s_1(Scode, Sname, City, Age),
                   s_2(Ucode, Uname), s_3(Scode, Ucode)
```

```
Mapping \mathcal{M}: { (c, n, ci) \mid s_1(c, n, ci, a) } \rightarrow student(c, n, ci)
                                                              \begin{array}{c|cccc} \{ & (c,n) & | & \mathsf{s}_2(c,n) & \} & \leadsto & \mathsf{university}(c,n) \\ \{ & (s,u) & | & \mathsf{s}_3(s,u) & \} & \leadsto & \mathsf{enrolled}(s,u) \end{array}
```

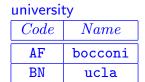

D. Calvanese Part 3: Information Integration KBDB - 2008/2009

Incompleteness and inconsistency in GAV systems

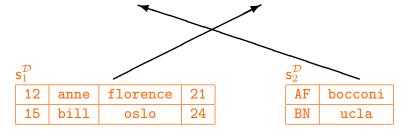

Chap. 3: Query answering with constraints

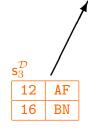

GAV with constraints - Example of retrieved global db

Code	Name	City
12	anne	florence
15	bill	oslo

enronea		
Scode	Ucode	
12	AF	
16	BN	

المراامط

Example of source database \mathcal{D} and corresponding retrieved global database $\mathcal{M}(\mathcal{D})$.

Part 3: Information Integration

Global integrity constraints

Query answering in GAV with constraints

Chap. 3: Query answering with constraints

GAV with constraints – Example of incompleteness

enrolled t	3
Scode	Ucode
12	AF
16	BN

student			
Code	Name	City	
12	anne	florence	
15	bill	oslo	
16	x	y	

 $s_3^{\mathcal{D}}(16,BN)$ and the mapping imply enrolled (16,BN) for all $\mathcal{B} \in Sem_{\mathcal{I}}(\mathcal{D})$.

Due to the inclusion dependency enrolled $[Scode] \subseteq \mathsf{student}[Code]$ in \mathcal{G} , **16** is the code of some student in all $\mathcal{B} \in Sem_{\mathcal{I}}(\mathcal{D})$.

Since \mathcal{D} does not provide information about name and city of the student with code 16, a global database that is legal for \mathcal{I} wrt \mathcal{D} may contain arbitrary values for these.

Incompleteness and inconsistency in GAV systems

Chap. 3: Query answering with constraints

GAV with constraints - Unfolding is not sufficient

$\mathbf{s}_1^{\mathcal{I}}$				
	12	anne	florence	21
	15	bill	oslo	24

$s_2^\mathcal{D}$	
AF	bocconi
BN	ucla

$s_3^\mathcal{D}$	
12	AF
16	BN

Consider the query: $q = \{ (c) \mid \mathsf{student}(c, n, ci) \}$ Unfolding of q wrt \mathcal{M} : $\mathsf{unf}_{\mathcal{M}}(q) = \{ (c) \mid \mathsf{s}_1(c, n, ci, a) \}$

The query $unf_{\mathcal{M}}(q)$ retrieves from \mathcal{D} only the answer $\{12, 15\}$, while the correct answer would be {12, 15, 16}.

The simple unfolding strategy is not sufficient for GAV with constraints.

Global integrity constraints

Query answering in GAV with constraints

Incompleteness and inconsistency in GAV systems

Chap. 3: Query answering with constraints

GAV with constraints – Example of inconsistency

$$egin{array}{c|cccc} \mathbf{s}_1^{\mathcal{D}} & & & & \\ \hline 12 & anne & florence & 21 \\ \hline 12 & bill & oslo & 24 \\ \hline \end{array}$$

student			
Code	Name	City	
12	anne	florence	
12	bill	oslo	

The tuples in $s_1^{\mathcal{D}}$ and the mapping imply student (12, anne, florence) and student $^{\mathcal{B}}(12, \text{bill}, \text{oslo})$, for all \mathcal{B} that satisfy the mapping.

Due to the key dependency $key(student) = \{Code\}$ in \mathcal{G} , there is **no global** database that satisfies the mapping and is legal wrt the global schema, i.e., $Sem_{\mathcal{I}}(\mathcal{D}) = \emptyset.$

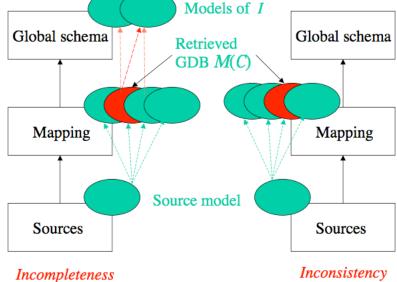

GAV data integration systems with constraints

Constraints in \mathcal{G}	Type of mapping	Incompleteness	Inconsistency
no	GAV	yes / no	no
no	(G)LAV	yes	no
IDs	GAV	yes	no
KDs	GAV	yes / no	yes
IDs + KDs	GAV	yes	yes
yes	(G)LAV	yes	yes

Global integrity constraints

Query answering in GAV with constraints

Query answering in GAV under inclusion dependencies

Chap. 3: Query answering with constraints

Inclusion dependencies – Example retrieved global db

Source database \mathcal{D} :

1971 Totti Roma

Del Piero Juve Torino

Buffon 1978 Juve

Retrieved global database $\mathcal{M}(\mathcal{D})$:

player:

1971 Totti Roma 1978 Juve

Juve Torino Del Piero team:

Query answering in GAV under inclusion dependencies

Chap. 3: Query answering with constraints

Inclusion dependencies – Example retrieved global db

player:

Totti	1971	Roma
Buffon	1978	Juve
Del Piero	α	Juve

team:

Juve	Torino	Del Piero

The ID on the global schema tells us that Del Piero is a player of Juve.

All global databases satisfying \mathcal{I} have at least the tuples shown above, where α is some value of the domain Δ .

Warnings

- There may be an **infinite number** of databases satisfying \mathcal{I} .
- ② In case of cyclic IDs, a database satisfying \mathcal{I} may be of infinite size.

Global integrity constraints

Query answering in GAV with constraints

Query answering in GAV under inclusion dependencies

Chap. 3: Query answering with constraints

Inclusion dependencies – Example retrieved global db

player:

Totti	1971	Roma
Buffon	1978	Juve
Del Piero	α	Juve

team:

Torino Del Piero Juve

The ID on the global schema tells us that Del Piero is a player of Juve.

All global databases satisfying \mathcal{I} have at least the tuples shown above, where α is some value of the domain Δ .

Consider the query
$$q = \{ (x, z) \mid \mathsf{player}(x, y, z) \}.$$
 $cert(q, \mathcal{I}, \mathcal{D}) = \{ (\mathsf{Totti}, \mathsf{Roma}), (\mathsf{Buffon}, \mathsf{Juve}), (\mathsf{Del\ Piero}, \mathsf{Juve}) \}.$

Chasing inclusion dependencies - Infinite construction

Intuitive strategy: Add new facts until IDs are satisfied.

Problem: Infinite construction in the presence of cyclic IDs.

Example

Let r be binary with $r[2] \subseteq r[1]$.

Suppose $\mathcal{M}(\mathcal{D}) = \{ r(a, b) \}.$

- lacktriangledown add $r(b, c_1)$
- **a** add $r(c_1, c_2)$
- **3** add $r(c_2, c_3)$
- ... (ad infinitum)

Example

Let r, s be binary with

$$r[1] \subseteq s[1], \quad s[2] \subseteq r[1].$$

Suppose $\mathcal{M}(\mathcal{D}) = \{ r(a,b) \}.$

- lacksquare add $s(a, c_1)$
- **2** add $r(c_1, c_2)$
- **3** add $s(c_1, c_3)$
- **4** add $r(c_3, c_4)$
- ... (ad infinitum)

Part 3: Information Integration

Query answering in GAV with constraints

Query answering in GAV under inclusion dependencies

Chap. 3: Query answering with constraints

The chase of a database

Def.: Chase of a database

The chase of a database is the exhaustive application of a set of rules that transform the database, in order to make it consistent with a set of integrity constraints.

Typically, there will be one or more chase rules for each different type of constraint.

The ID-chase rule

The chase for IDs has only one rule, the ID-chase rule.

Let \mathcal{D} be a database:

```
if the schema contains the ID r[i_1,\ldots,i_k]\subseteq s[j_1,\ldots,j_k]
and there is a fact in \mathcal{D} of the form r(a_1,\ldots,a_n)
and there are no facts in \mathcal{D} of the form s(b_1,\ldots,b_m)
      such that a_{i_{\ell}} = b_{j_{\ell}} for each \ell \in \{1, \dots, k\},
then add to \mathcal{D} the fact s(c_1,\ldots,c_m),
       where for each h \in \{1, \dots, m\},
           if h=j_\ell for some \ell then c_h=a_{i_\ell}
           otherwise c_h is a new constant symbol (not in \mathcal{D} yet)
```

Notice: **New** existential symbols are introduced (skolem terms).

Global integrity constraints

Part 3: Information Integration

KBDB - 2008/2009

Query answering in GAV under inclusion dependencies

Query answering in GAV with constraints

Chap. 3: Query answering with constraints

Properties of the chase

- Bad news: the chase is in general infinite.
- Good news: the chase identifies a canonical model. A canonical model is a database that "represents" all the models of the system.
- We can use the chase to prove soundness and completeness of a query processing method . . .
- ... but only for positive queries!

Limiting the chase

Why don't we use a finite number of existential constants in the chase?

Example

Consider $r[1] \subseteq s[1]$ and $s[2] \subseteq r[1]$, and suppose $\mathcal{M}(\mathcal{D}) = \{ r(a,b) \}$.

Compute chase($\mathcal{M}(\mathcal{D})$) with only one new constant c_1 :

0)
$$r(a, b)$$

1) add
$$s(a, c_1)$$

2) add
$$r(c_1, c_1)$$

3) add
$$s(c_1, c_1)$$

This database is **not** a canonical model for \mathcal{I} wrt \mathcal{D} .

E.g., for query $q=\{\ (x)\mid s(x,y),s(y,y)\ \}$, we have $a\in q^{\mathrm{chase}(\mathcal{M}(\mathcal{D}))}$ while $a \notin cert(q, \mathcal{I}, \mathcal{D})$.

Arbitrarily limiting the chase is unsound, for any finite number of new constants.

Global integrity constraints

Part 3: Information Integration

Rewriting CQs under inclusion dependencies in GAV

Query answering in GAV with constraints Query answering in (G)LAV with constraints

Chap. 3: Query answering with constraints

Chasing the query

When chasing the data, the termination condition would need to take into account the query.

We consider an alternative approach, based on the idea of a query chase.

- Instead of chasing the data, we chase the query.
- Is the dual notion of the database chase.
- IDs are applied from right to left to the query atoms.
- Advantage: much easier termination conditions, which imply:
 - decidability properties
 - efficiency

This technique provides an algorithm for rewriting UCQs under IDs.

Query rewriting under inclusion dependencies

- Given a query q over the global schema \mathcal{G} , we look for a rewriting rew of q expressed over \mathcal{S} .
- A rewriting rew is **perfect** if $rew^{\mathcal{D}} = cert(q, \mathcal{I}, \mathcal{D})$, for every source database \mathcal{D} .
- With a perfect rewriting, we can do query answering by rewriting. \rightsquigarrow We avoid actually constructing the retrieved global database $\mathcal{M}(\mathcal{D})$.

. Calvanese

Part 3: Information Integration

Query answering in GAV with constraints

KBDB - 2008/2009

Chap. 3: Query answering with constraints

(117/167)

Rewriting CQs under inclusion dependencies in GAV

Rewriting rule for inclusion dependencies

Intuition: Use the IDs as basic rewriting rules.

Example

```
Consider a query q = \{ (x,z) \mid \mathsf{player}(x,y,z) \} and the constraint \mathsf{team}[\mathit{Tleader}, \mathit{Tname}] \subseteq \mathsf{player}[\mathit{Pname}, \mathit{Pteam}] as a logic rule: \mathsf{player}(w_3, w_4, w_1) \leftarrow \mathsf{team}(w_1, w_2, w_3) We add to the rewriting the query q' = \{ (x,z) \mid \mathsf{team}(z,y',x) \}.
```

Def.: Basic rewriting step

when an atom unifies with the **head** of the rule substitute the atom with the **body** of the rule

D. Calvanese Part

Query Rewriting for IDs - Algorithm ID-rewrite

Iterative execution of:

Reduction:

- Atoms that unify with other atoms are eliminated and the unification is
- Variables that appear only once are marked.

Basic rewriting step

- A rewriting step is applicable to an atom if it does not eliminate variables that appear somewhere else.
- May introduce fresh variables.

Note: The algorithm works directly for unions of conjunctive queries (UCQs), and produces an UCQ as result.

Part 3: Information Integration

The algorithm *ID-rewrite*

Query answering in GAV with constraints

Rewriting CQs under inclusion dependencies in GAV Chap. 3: Query answering with constraints

```
Input: relational schema \mathcal{G}, set \Psi_{ID} of IDs, UCQ Q
Output: perfect rewriting of Q
Q' := Q;
repeat
   Q_{aux} := Q';
   for each q \in Q_{aux} do
   (a) for each g_1, g_2 \in body(q) do
         if g_1 and g_2 unify then Q' := Q' \cup \{\tau(reduce(q, g_1, g_2))\};
   (b) for each g \in body(q) do
         for each ID \in \Psi_{ID} do
             if ID is applicable to g
                 then Q' := Q' \cup \{q[g/rewrite(g, ID)]\}
until Q_{aux} = Q';
return Q'
```

Query answering in GAV under IDs

Properties of ID-rewrite

- ID-rewrite terminates.
- *ID-rewrite* produces a perfect rewriting of the input query.

More precisely, let $unf_{\mathcal{M}}(q)$ be the **unfolding** of the query q wrt the GAV mapping \mathcal{M} .

Theorem

 $unf_{\mathcal{M}}(ID\text{-}rewrite(q))$ is a perfect rewriting of the query q.

Theorem

Query answering in GAV systems under IDs is in PTIME in data complexity (actually in LOGSPACE).

Part 3: Information Integration

Global integrity constraints

Query answering in GAV with constraints

Query answering in GAV under IDs and KDs

Chap. 3: Query answering with constraints

Query answering under IDs and KDs

We have already seen that in GAV systems under sound mappings.

- Key dependencies may give rise to inconsistencies.
- When $\mathcal{M}(\mathcal{D})$ violates the KDs, no legal database exists and query answering becomes trivial.

How do KDs interact with IDs?

Theorem

Query answering under IDs and KDs is undecidable.

Proof: By reduction from implication of IDs and KDs.

We need to look for syntactic restrictions on the form of the dependencies that ensures decidability.

KBDB - 2008/2009 D. Calvanese Part 3: Information Integration

Non-key-conflicting IDs

Def.: Non-key-conflicting ID (NKCID)

Is an ID of the form $r_1[\vec{x}_1] \subseteq r_2[\vec{x}_2]$ where \vec{x}_2 is **not a strict superset** of $key(r_2)$.

Example

Let r be of arity 3 and s of arity 4 with $key(s) = \{1, 2\}$.

- The following are NKCIDs:
 - $r[2] \subseteq s[2]$, since $\{2\}$ is a strict subset of key(s).
 - $r[2,3] \subseteq s[1,2]$, since $\{1,2\}$ coincides with key(s).
 - $r[1,2] \subseteq s[2,3]$, since $1 \in key(s)$ but $1 \notin \{2,3\}$.
- The following is not a NKCID: $r[1,2,3] \subset s[1,2,4]$.

Note: Foreign keys (FKs) are a special case of NKCIDs.

Query answering in GAV with constraints

Query answering in GAV under IDs and KDs

Chap. 3: Query answering with constraints

Separation for IDs and KDs

Theorem (IDs-KDs separation)

Under KDs and NKCIDs, if $\mathcal{M}(\mathcal{D})$ satisfies the KDs, then the KDs can be **ignored** wrt certain answers of a user query q.

Intuition: For NKCIDs, when applying the ID-chase rule to a tuple $\vec{t_1} \in r_1^{\mathcal{B}}$, we can choose the tuple $\vec{t_2}$ to introduce in $r_2^{\mathcal{B}}$ so that it does not violate $key(r_2)$:

- When $key(r_2) \not\subseteq \vec{x}_2$, fresh constants in \vec{t}_2 are chosen for key attributes, and so there is no other tuple in $r_2^{\mathcal{B}}$ coinciding with \vec{t}_2 on all key attributes.
- When $key(r_2) = \vec{x}_2$, if there is already a tuple \vec{t} in $r_2^{\mathcal{B}}$ such that $\vec{t_1}[\vec{x_1}] = \vec{t}[\vec{x_2}]$, we choose \vec{t} for $\vec{t_2}$.

Query answering becomes undecidable as soon as we extend the language of the IDs.

Query processing under separable KDs and IDs

Overall query answering algorithm:

- Verify consistency of $\mathcal{M}(\mathcal{D})$ with respect to KDs.
- Compute ID-rewrite of the input query.
- **1** Unfold wrt \mathcal{M} the query computed at previous step.
- Evaluate the unfolded query over the sources.

Note:

- The KD consistency check can be done by suitable CQs with inequality.
- The computation of $\mathcal{M}(\mathcal{D})$ can be avoided (by unfolding the queries for the KD consistency check).

Global integrity constraints

Query answering in GAV with constraints

Chap. 3: Query answering with constraints

Query answering in GAV under IDs and KDs

Checking KD consistency – Example

```
player[Pname, Pteam]
Relation:
Key dependency:
                  key(player) = \{Pname\}
```

Query to check (in)consistency of the KD:

```
q = \{ () \mid \mathsf{player}(x,y), \mathsf{player}(x,z), y \neq z \}
```

is true iff the instance of player violates the KD.

```
Mapping \mathcal{M}: { (x,y) \mid s_1(x,y) \lor s_2(x,y) } \rightarrow player(x,y)
Unfolding of q wrt \mathcal{M}: \{ () \mid s_1(x,y), s_1(x,z), y \neq z \vee \}
                                           s_1(x,y), s_2(x,z), y \neq z \vee
                                           s_2(x, y), s_1(x, z), y \neq z \vee
                                           s_2(x,y), s_2(x,z), y \neq z }
```

Query answering in GAV under separable IDs+KDs

Theorem (CaLR03)

Answering conjunctive queries in GAV systems under KDs and NKCIDs is in PTIME in data complexity (actually in LOGSPACE).

Can we extend these results to more expressive user queries?

- The rewriting technique extends immediately to unions of CQs ID-rewrite $(q_1 \lor \cdots \lor q_n) = ID$ -rewrite $(q_1) \lor \cdots \lor ID$ -rewrite (q_n) .
- This is not the case for recursive queries.

Theorem (CaRo03)

Answering recursive queries under KDs and FKs is undecidable. Answering recursive queries under IDs is undecidable.

Part 3: Information Integration

Query answering in GAV with constraints

Query answering in GAV under IDs, KDs, and EDs Chap. 3: Query answering with constraints Query answering under IDs and EDs

Under EDs:

Global integrity constraints

- Possibility of inconsistencies.
- When $\mathcal{M}(\mathcal{D})$ violates the EDs, no legal database exists and query answering becomes trivial.

Under IDs and EDs:

- How do EDs and IDs interact?
- Is query answering separable?
- Is query answering decidable?

Exclusion dependencies – Example

Global schema \mathcal{G} : player(Pname, YOB, Pteam)

team(Tname, Tcity, Tleader)

coach(Cname, Cteam)

Constraints: $team[Tleader, Tname] \subseteq player[Pname, Pteam]$

 $coach[Cname] \cap player[Pname] = \emptyset$

Sources S: s₁ and s₃ store players

stores teams

s₄ stores coaches

Mapping \mathcal{M} : { $(x,y,z) \mid s_1(x,y,z) \vee s_3(x,y,z)$ } \leadsto player(x,y,z) $\{\ (x,y,z)\ |\ \mathsf{s}_2(x,y,z)\ \}\ \leadsto\ \mathsf{team}(x,y,z)$ $\{(x,y) \mid s_4(x,y)\} \rightsquigarrow \operatorname{coach}(x,y)$

Chap. 3: Query answering with constraints

Deductive closure of EDs under IDs – Example

Can we saturate (close) the EDs by adding all the EDs that are logical consequences of the EDs and IDs?

Example

From

 $team[Tleader, Tname] \subseteq player[Pname, Pteam]$ $\mathsf{coach}[\mathit{Cname}] \cap \mathsf{player}[\mathit{Pname}] = \emptyset$

it follows that

 $coach[Cname] \cap team[Tleader] = \emptyset.$

This constraint is violated by the retrieved global database $\mathcal{M}(\mathcal{D})$.

D. Calvanese

Deductive closure of EDs under IDs

Def.: Derivation rule of EDs under EDs and IDs

From the ID $r[i_1, ..., i_k, i_{k+1}, ..., i_h] \subseteq s[j_1, ..., j_k, j_{k+1}, ..., j_h]$ and the ED $s[j_1,\ldots,j_k]\cap t[\ell_1,\ldots,\ell_k]=\emptyset$ derive the ED $r[i_1,\ldots,i_k]\cap t[\ell_1,\ldots,\ell_k]=\emptyset$.

Corresponds to a simple application of resolution on the FOL sentences corresponding to EDs and IDs.

Theorem

If the set of EDs is closed with respect to the above rule, it contains all EDs that are logical consequences of the initial EDs and IDs.

Part 3: Information Integration

Global integrity constraints

Query answering in GAV with constraints

Query answering in GAV under IDs, KDs, and EDs

Chap. 3: Query answering with constraints

Query answering in GAV under IDs and EDs

Theorem (ID-ED Separation)

Under IDs and EDs,

if $\mathcal{M}(\mathcal{D})$ satisfies all EDs derived from the IDs and the original EDs, then the EDs can be ignored wrt certain answers of a query.

We obtain a method for query answering in GAV under EDs and IDs:

- Close the set of EDs with respect to the IDs.
- **②** Verify consistency of $\mathcal{M}(\mathcal{D})$ with respect to EDs.
- Ompute ID-rewrite of the input query.
- Unfold the query computed at the previous step.
- Evaluate the query over the sources.

The ED consistency check can be done by suitable CQs.

Global integrity constraints (G)LAV systems and integrity constraints Query answering in GAV with constraints Query answering in (G)LAV with constraints

Chap. 3: Query answering with constraints

(G)LAV system with integrity constraints

We consider a data integration system $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ where:

- *G* is a global schema with constraints.
- \mathcal{M} is a set of LAV mappings, whose assertions have the form $\phi_{\mathcal{S}} \rightsquigarrow \phi_{\mathcal{G}}$ and are interpreted as

$$\forall \vec{x} \cdot \phi_{\mathcal{S}}(\vec{x}) \to \phi_{\mathcal{G}}(\vec{x}),$$

where $\phi_{\mathcal{S}}$ is a CQ over \mathcal{S} , and $\phi_{\mathcal{G}}$ is a CQ over \mathcal{G} .

Basic observation: Since \mathcal{G} does have constraints, the canonical retrieved global database $Can_{\mathcal{I}}(\mathcal{D})$ may not be legal for \mathcal{G} .

D. Calvanese

Semantics of (G)LAV systems with integrity constraints

Given a source db \mathcal{D} , a global db \mathcal{B} (over Δ) satisfies \mathcal{I} relative to \mathcal{D} if:

- 1 It is legal wrt the global schema, i.e., it satisfies the ICs.
- global database $Can_{\mathcal{I}}(\mathcal{D})$ (sound mappings).

Recall:

- $Can_{\mathcal{I}}(\mathcal{D})$ is obtained by evaluating, for each mapping assertion $\phi_{\mathcal{S}} \leadsto \phi_{\mathcal{G}}$, the query $\phi_{\mathcal{S}}$ over \mathcal{D} , and using the obtained tuples to populate the global relations according to $\phi_{\mathcal{G}}$, using fresh constants for existentially quantified elements.
- We are interested in certain answers to a query, i.e., those that hold for **all** global databases that satisfy \mathcal{I} relative to \mathcal{D} .

Chap. 3: Query answering with constraints

(G)LAV systems under IDs

Under IDs only, we can exploit also for (G)LAV the previous results for GAV, by turning the (G)LAV mappings into GAV mappings:

- We transform a (G)LAV integration system $\mathcal{I} = \langle \mathcal{G}, \mathcal{S}, \mathcal{M} \rangle$ with IDs only into a GAV system $\mathcal{I}' = \langle \mathcal{G}', \mathcal{S}, \mathcal{M}' \rangle$.
- With respect to \mathcal{I} , the transformed system \mathcal{I}' contains auxiliary IDs and auxiliary global relation symbols
- The transformation is query-preserving:

For every CQ q and for every source database \mathcal{D} , the certain answers to qwrt \mathcal{I} and \mathcal{D} are equal to the certain answers to q wrt \mathcal{I}' and \mathcal{D} .

KBDB - 2008/2009 D. Calvanese Part 3: Information Integration

Transforming LAV into GAV

Consider a LAV mapping:

$$s(x_1,\ldots,x_k) \rightsquigarrow \{(x_1,\ldots,x_k) \mid conj(x_1,\ldots,x_k,x_{k+1},\ldots,x_h)\}$$

where $conj(x_1, \ldots, x_k, x_{k+1}, \ldots, x_h)$ is a conjunction of atoms over the variables x_1, \ldots, x_h , whose predicate symbols are global relations.

We transform it into a GAV mapping and a set of IDs as follows:

- We introduce two new global relations: image s_{im}/k , and expand s_{exp}/h .
- We replace the LAV mapping with the GAV mapping

$$\{ (x_1, \ldots, x_k) \mid s(x_1, \ldots, x_k) \} \sim s_{im}(x_1, \ldots, x_k)$$

• We introduce the following IDs:

$$\begin{split} s_{im}[1,\ldots,k] &\subseteq s_{exp}[1,\ldots,k] \\ s_{exp}[i_1,\ldots,i_\ell] &\subseteq g[1,\ldots,\ell], \\ \text{for each atom } g(x_{i_1},\ldots,x_{i_\ell}) \text{ in } conj(x_1,\ldots,x_k,x_{k+1},\ldots,x_h) \end{split}$$

Part 3: Information Integration

Query answering in (G)LAV with constraints

Query answering in (G)LAV under inclusion dependencies

Chap. 3: Query answering with constraints

Transforming LAV into GAV – Example

Initial LAV mappings:
$$s(x,y) \sim \{(x,y) \mid r_1(x,z), r_2(y,w)\}$$

 $t(x,y) \sim \{(x,y) \mid r_1(x,z), r_3(y,x)\}$

We introduce two new global relations for each mapping assertion:

$$s_{im}/2$$
, $s_{exp}/4$, and $t_{im}/2$, $t_{exp}/3$

Transformed GAV mappings:
$$\{(x,y) \mid s(x,y)\} \sim s_{im}(x,y)$$

 $\{(x,y) \mid t(x,y)\} \sim t_{im}(x,y)$

IDs introduced by the transformation:

$$\begin{array}{ll} s_{im}[1,2] \subseteq s_{exp}[1,2] & s_{exp}[1,3] \subseteq r_1[1,2] & s_{exp}[2,4] \subseteq r_2[1,2] \\ t_{im}[1,2] \subseteq t_{exp}[1,2] & t_{exp}[1,3] \subseteq r_1[1,2] & t_{exp}[2,1] \subseteq r_3[1,2] \end{array}$$

Part 3: Information Integration

Global integrity constraints LAV systems and key dependencies Query answering in GAV with constraints

Query answering in (G)LAV with constraints

Chap. 3: Query answering with constraints

(G)LAV systems under KDs

We consider a (G)LAV system with only KDs in the global schema:

- The transformation of (G)LAV into GAV is still correct in the presence of KDs.
- More precisely, starting from a (G)LAV system \mathcal{I} with KDs, we obtain a GAV system \mathcal{I}' with KDs and IDs.
- ullet But in general, \mathcal{I}' is such that the IDs added by the transformation are **key-conflicting** IDs (i.e., these IDs are not NKCIDs), and hence the KDs are in general **not separable**.

Therefore, it is not possible to apply the query answering method for (G)LAV systems under separable KDs and IDs.

Question: Can we find some analogous query answering method based on query rewriting?

KBDB - 2008/2009 D. Calvanese Part 3: Information Integration

(G)LAV systems under KDs - A negative result

Problem: KDs and LAV mappings derive new equality-generating dependencies (not simple KDs).

Theorem (AbDu98)

Given a LAV data integration system ${\cal I}$ with KDs in the global schema and a conjunctive query q_i in general there does not exist a first-order query rew such that $rew^{\mathcal{D}} = cert(q, \mathcal{I}, \mathcal{D})$ for every source database \mathcal{D} .

In other words, in LAV with KDs, conjunctive queries are **not first-order** rewritable, and one would need to resort to more powerful relational query languages (e.g., Datalog).

Part 3: Information Integration

Global integrity constraints LAV systems and key dependencies Query answering in GAV with constraints

Chap. 3: Query answering with constraints

Data integration with constraints – First-order rewritability

Can query answering in integration systems be performed by first-order (UCQ) rewriting?

- GAV with IDs + EDs: yes
- GAV with IDs + KDs + EDs: only if KDs and IDs are separable
- (G)LAV with IDs + EDs: yes
- (G)LAV with KDs: no
