

Exercise: (Section 3.3.2 from textbook)

E 4.1

Consider the following languages over $\Sigma = \{0, 1\}$

$$L_e = \{ \langle M \rangle \mid \mathcal{L}(M) = \emptyset \}$$

$$L_{ne} = \{ \langle M \rangle \mid \mathcal{L}(M) \neq \emptyset \}$$

Hence: L_e ... set of all strings that encode T.M.s that accept the empty language

L_{ne} ... complement of L_e

Claim 1: L_{ne} is R.E.

Proof: construct NTM N for L_{ne}
(and then convert N to an ordinary T.M.)

N works as follows: on input $\langle M \rangle$

1) guess a string $w \in \Sigma^*$

2) simulate M on w (like a UTM)

3) accept $\langle M \rangle$ if M accepts w

We have $\langle M \rangle \in \mathcal{L}(N) \iff \exists w \text{ s.t. } \langle M, w \rangle \in \mathcal{L}(U)$
 $\iff \exists w \text{ s.t. } w \in \mathcal{L}(M)$
 $\iff \langle M \rangle \in L_{ne}$

Claim 2: L_{ne} is non-recursive

E4.2

Proof: by reduction from L_n to L_{ne}

Reduction R is a function computable by a halting T.M.

with input: instance $\langle M, w \rangle$ of L_n

output: instance $\Sigma(M')$ of L_{ne}

and s.t. $\langle M, w \rangle \in L_n \iff \Sigma(M') \in L_{ne}$

Description of M' :

- M' ignores completely its own input string x
- instead, it replaces its input by the string $\langle M, w \rangle$, and runs M on w (see (*) below)
- if M accepts w , then M' accepts x
- if M never halts on w or rejects w , then M' also never halts or rejects x

Note: if $w \in \Sigma(M) \Rightarrow \Sigma(M') = \Sigma^*$

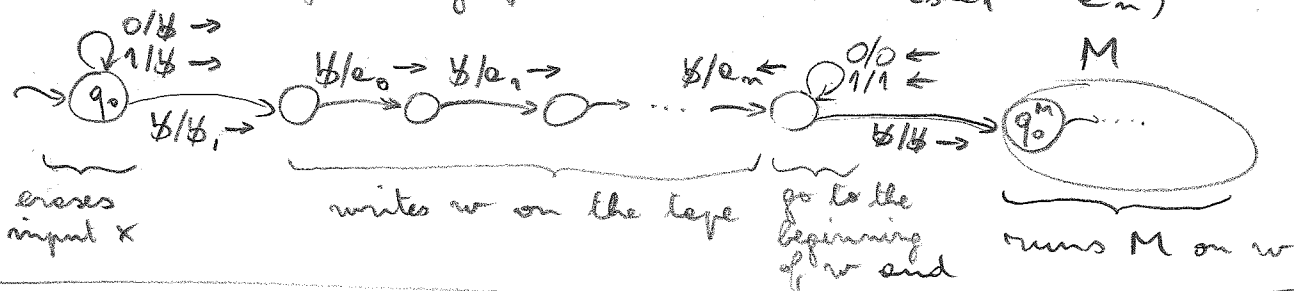

if $w \notin \Sigma(M) \Rightarrow \Sigma(M') = \emptyset$

hence $\langle M, w \rangle \in L_n \iff \Sigma(M') \in L_{ne}$

We can construct a halting T.M. M_R that, given $\langle M, w \rangle$ as input, constructs $\Sigma(M')$ for an M' that behaves as above.

q.e.d.

(*) M' has the following form: (let $w = a_0 a_1 \dots a_n$)

To sum up, we have that L_{ne} is RE but non-recursive.

Hence L_e must be non-RE.

Exercise: 9.2.1

E4.3

The halting problem, L_{Halt} , the set $\langle M, w \rangle$ s.t. M halts on w (with or without accepting) is R.E. but not recursive.

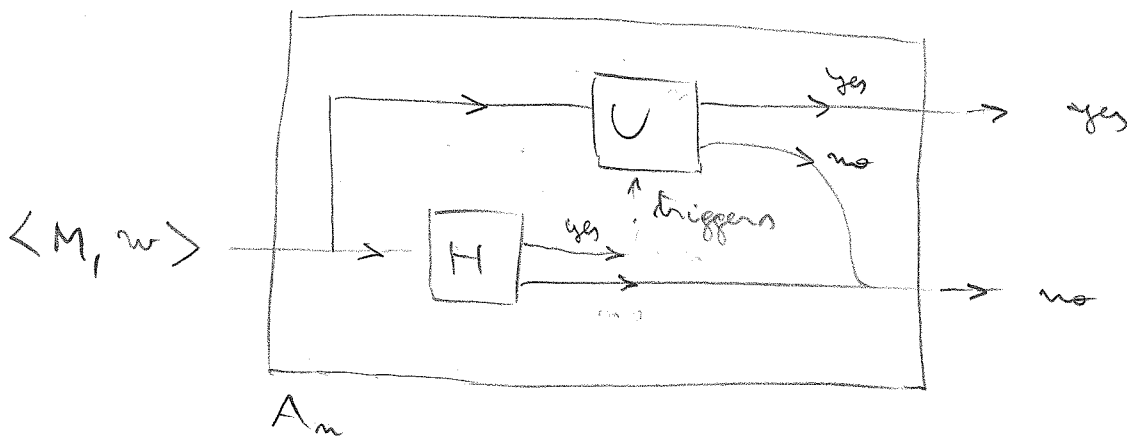

To show R.E., we construct a T.M. H s.t.

$$L(H) := L_H = \{ \langle M, w \rangle \mid M \text{ halts on } w \}$$

To show that L_H is not recursive, we assume by contradiction it is so, and derive that L_u is recursive.

By contradiction, let H be an algorithm for L_H and U a procedure for L_u

A_u would be an algorithm for L_u .
Contradiction

Let L be R.E. and \bar{L} be non-R.E.

Consider $L' = \{0w \mid w \in L\} \cup \{1w \mid w \notin L\}$.

What do we know about L' and \bar{L}' ?

We show that L' is non-R.E.

Suppose by contradiction that we have a procedure $M_{L'}$ for L' .

Then we can construct a procedure $M_{\bar{L}}$ for \bar{L} as follows

- on input w , $M_{\bar{L}}$ changes the input to $1w$ and simulates $M_{L'}$.
- if $M_{L'}$ accepts $1w$, then $w \in \bar{L}$, and $M_{\bar{L}}$ accepts
- if $M_{L'}$ does not terminate or terminates and answers no then $w \notin \bar{L}$, and $M_{\bar{L}}$ does not terminate or terminates and answers no.

$\Rightarrow M_{\bar{L}}$ would accept exactly \bar{L} . Contradiction

$$\bar{L}' = \{0w \mid w \notin L\} \cup \{1w \mid w \in L\} \cup \{\epsilon\}$$

Reasoning as for L' , we get that \bar{L}' is non-R.E.

\bar{H} , the complement of the halting problem, i.e., the set of pairs $\langle M, w \rangle$ such that M on input w does not halt, is non-R.E.

Proof: By reduction from \bar{L}_u , which is non-R.E.

Idea: we show how to convert any TM M into another TM M_H s.t. M_H halts on w iff M accepts w .

Construction:

- 1) Ensure that M_H does not halt unless M accepts.
 - add to the states of M a new loop state q , with

$$\delta(q, x) = (q, x, \epsilon) \quad \text{for all } x \in \Gamma$$
 - for each $\delta(q, y)$ that is undefined and $q \notin F$, add $\delta(q, y) = (q, y, \epsilon)$
- 2) Ensure that, if M accepts, then M_H halts
 - make $\delta(q, x)$ undefined for all $q \in F$ and $x \in \Gamma$
- 3) The other moves of M_H are as those of M .
