**Final exam – 7/6/2005 – Part 1**  
**Solutions**

**Problem 1.1** [4.5 points] Decide which of the following statements is TRUE and which is FALSE. You must give a brief explanation of your answer to receive full credit.

- (a) For all languages  $L_1$  and  $L_2$ , it holds that  $L_1^* \cap L_2^* = (L_1 \cap L_2)^*$ .
- (b) If  $L_1$  is regular and  $L_2$  is non-regular, then  $L_1 \cup L_2$  must be non-regular.
- (c) There exists a language  $L$  such that  $L$  is not regular but  $L^*$  is regular.

*Solution:*

- (a) FALSE. Consider for example  $L_1 = \{a\}$  and  $L_2 = \{aa\}$ . Then  $L_1^* \cap L_2^* = (aa)^*$ , but  $L_1 \cap L_2 = \emptyset$ , and hence  $(L_1 \cap L_2)^* = \varepsilon$ .
- (b) FALSE. Consider for example  $L_1 = \Sigma^*$  and  $L_2$  some arbitrary language over  $\Sigma$ . Then  $L_1 \cup L_2 = \Sigma^*$ , which is regular.
- (c) TRUE. Consider  $L = \{a\} \cup \{a^n \mid n \text{ is prime}\}$ . Then  $L$  is not regular. On the other hand,  $L^* = a^*$ , since already  $a \in L$  generates in  $L^*$  strings of arbitrary length of  $a$ 's. Hence  $L^*$  is regular.

**Problem 1.2** [1.5 points] Show that  $L^* = L \cdot L^*$  if and only if  $\varepsilon \in L$ .

*Solution:* Let  $L^+ = L \cdot L^*$ . By definition,  $L^* = \bigcup_{n \geq 0} L^n$ , and  $L^+ = L \cdot L^* = \bigcup_{n \geq 1} L^n$ . Hence,  $L^+ \subseteq L^*$ , and  $L^+$  and  $L^*$  might differ only due to  $L^0 = \varepsilon$ . If  $\varepsilon \in L$ , then also  $\varepsilon \in L^+$ , and hence  $L^+ = L^*$ . If  $\varepsilon \notin L$ , then also  $\varepsilon \notin L^+$ , while  $\varepsilon \in L^*$ , and hence  $L^+ \neq L^*$ .

**Problem 1.3** [6 points] Consider the regular expression  $E = ((1 \cdot 0)^* \cdot 0)^* + (1 \cdot 1)$ . Construct an  $\varepsilon$ -NFA  $A_\varepsilon$  such that  $\mathcal{L}(A_\varepsilon) = \mathcal{L}(E)$ . Simplify intermediate results whenever possible. Then, by eliminating  $\varepsilon$ -transitions from  $A_\varepsilon$ , construct an NFA  $A$  such that  $\mathcal{L}(A) = \mathcal{L}(A_\varepsilon)$ . Illustrate the steps of the algorithm you have followed to construct  $A_\varepsilon$  and  $A$ .

*Solution:* Construction of  $A_\varepsilon$ :

$1 \cdot 1$

$((1 \cdot 0)^* \cdot 0)^* + (1 \cdot 1)$

$((1 \cdot 0)^* \cdot 0)^* + (1 \cdot 1)$  simplified

Construction of  $A$ : Let  $A_\varepsilon = (Q, \Sigma, \delta_\varepsilon, q_0, F_\varepsilon)$ . Then  $A = (Q, \Sigma, \delta, q_0, F)$ , where

$$\delta(q, a) = \text{Eclose} \left( \bigcup_{p_i \in \text{Eclose}(q)} \delta_\varepsilon(p_i, a) \right), \quad \text{for each } q \in Q \text{ and } a \in \Sigma,$$

and

$$F = \begin{cases} F_\varepsilon, & \text{if } \varepsilon \notin \mathcal{L}(A_\varepsilon) \\ F_\varepsilon \cup \{q_0\}, & \text{if } \varepsilon \in \mathcal{L}(A_\varepsilon) \end{cases}$$

In our case, we obtain:

**Problem 1.4** [6 points] Consider the following DFA  $A$  over  $\{0, 1\}$ :

Construct a regular expression  $E$  such that  $\mathcal{L}(E) = \mathcal{L}(A)$ . Illustrate the steps of the algorithm you have followed to construct  $E$ .

*Solution:* We construct the regular expressions  $E_{ij}^k$  inductively. For the inductive case, we use the following rule:

$$E_{ij}^k = E_{ij}^{k-1} + E_{ik}^{k-1} \cdot (E_{kk}^{k-1})^* \cdot E_{kj}^{k-1}$$

The expressions  $E_{ij}^k$  are as follows (we have specified only those that are necessary to construct  $E$ ):

$k$	$E_{11}^k$	$E_{12}^k$	$E_{13}^k$	$E_{21}^k$	$E_{22}^k$	$E_{23}^k$	$E_{31}^k$	$E_{32}^k$	$E_{33}^k$
0	$\varepsilon$	0	1	1	0	$\emptyset$	$\emptyset$	1	0
1	$\varepsilon$	0	0	1	$0 + 10$	11	$\emptyset$	1	0
2	—	$0 + 0(0+10)^*(0+10)$	$0 + 0(0+10)^*11$	—	—	—	—	$1 + 1(0+10)^*(0+10)$	$0 + 1(0+10)^*0$
3	—	$E_{12}^2 + E_{13}^2 \cdot (E_{33}^2)^* \cdot E_{32}^2$	—	—	—	—	—	—	—

Then,  $E = E_{12}^3 = (0 + 0(0+10)^*(0+10)) + (0 + 0(0+10)^*11) \cdot (0 + 1(0+10)^*0)^* \cdot (1 + 1(0+10)^*(0+10))$ .

**Problem 1.5** [5 points] The *quotient*  $L_1/L_2$  of two languages  $L_1$  and  $L_2$  is defined as

$$L_1/L_2 = \{x \mid \text{there is } y \in L_2 \text{ such that } xy \in L_1\}$$

For example, if  $L_1 = \{w \in \{0,1\}^* \mid w \text{ has an even number of 0's}\}$ ,  $L_2 = \{0\}$ , and  $L_3 = \{0,00\}$ , then  $L_1/L_2 = \{w \in \{0,1\}^* \mid w \text{ has an odd number of 0's}\}$ , and  $L_1/L_3 = \{0,1\}^*$ .

Show that, for an *arbitrary* language  $L_2$ , if  $L_1$  is regular, then  $L_1/L_2$  is also regular.

[*Hint*: Start from a DFA  $A$  for  $L_1$ , and show how to modify the set of final states of  $A$  to obtain a DFA for  $L_1/L_2$ .]

*Solution*: Since  $L_1$  is regular, there is a DFA  $A = (Q, \Sigma, \delta, q_0, F)$  such that  $\mathcal{L}(A) = L_1$ . We show that the DFA  $A' = (Q, \Sigma, \delta, q_0, F')$ , with  $F' = \{q \in Q \mid \text{there is } y \in L_2 \text{ s.t. } \hat{\delta}(q, y) \in F\}$ , accepts  $L_1/L_2$ . This proves that  $L_1/L_2$  is regular.

Consider a word  $x \in L_1/L_2$ . By definition of  $L_1/L_2$ , there is a word  $y \in L_2$  such that  $xy \in L_1$ . Since  $xy \in L_1$ , we have that  $\hat{\delta}(q_0, xy) \in F$ , and moreover there is a state  $q \in Q$  such that  $\hat{\delta}(q_0, x) = q$ . We have that  $\hat{\delta}(q, y) = \hat{\delta}(\hat{\delta}(q_0, x), y) = \hat{\delta}(q_0, xy)$ . Hence  $\hat{\delta}(q, y) \in F$ , and since  $y \in L_2$ , it follows that  $q \in F'$ , and therefore  $x \in \mathcal{L}(A')$ .

Conversely, consider a word  $x \in \mathcal{L}(A')$ . By definition of language accepted by a DFA, we have that  $q = \hat{\delta}(q_0, x) \in F'$ , and by definition of  $F'$ , there is a word  $y \in L_2$  such that  $\hat{\delta}(q, y) \in F$ . Hence,  $\hat{\delta}(q_0, xy) = \hat{\delta}(\hat{\delta}(q_0, x), y) = \hat{\delta}(q, y) \in F$ , and it follows that  $xy \in \mathcal{L}(A) = L_1$ . By definition of  $L_1/L_2$ , we have that  $x \in L_1/L_2$ .

Note that in the above proof we did not make use of any assumption on  $L_2$ , which in fact may be an arbitrary language (possibly non-regular, or even non-recursively enumerable).

**Problem 1.6** [3 points] Show that the language  $\{uawb \mid u, w \in \{a, b\}^*, \text{ with } |u| = |w|\}$  is context free by exhibiting a context free grammar that generates it.

*Solution*: A grammar that generates the language  $\{uawb \mid u, w \in \{a, b\}^*, \text{ with } |u| = |w|\}$  is  $G = (\{S, T, X\}, \{a, b\}, P, S)$ , where  $P$  consists of the following productions:

$$\begin{aligned} S &\longrightarrow Tb \\ T &\longrightarrow a \mid XTX \\ X &\longrightarrow a \mid b \end{aligned}$$

**Problem 1.7** [4 points] Consider the grammar  $G = (\{S, T\}, \{0, 1\}, P, S)$ , where  $P$  consists of the following productions

$$\begin{aligned} S &\longrightarrow 0S \mid 1T \mid 0 \\ T &\longrightarrow 1T \mid 1 \end{aligned}$$

Show that no string in the language  $\mathcal{L}(G)$  contains the substring 10.

*Solution*: Let  $\alpha$  be a sentential form (i.e., a sequence of terminals and non-terminals) derived using  $G$ . We show by induction on the length  $n$  of the derivation of  $\alpha$  that  $\alpha$  does not contain any of the substrings 10, 1S, S0, SS, T0, or TS. The claim then follows.

*Base case*:  $n = 1$ . The possible derivations of length 1 of sentential forms for  $G$  are  $S \Rightarrow 0S$ ,  $S \Rightarrow 1T$ , and  $S \Rightarrow 0$ . Neither  $0S$ , nor  $1T$ , nor  $0$  contain as substring 10, 1S, S0, SS, T0, or TS.

*Inductive case*: Let  $S \xRightarrow{*} \alpha \Rightarrow \beta$  be a derivation of  $\beta$  of length  $n + 1$ . By inductive hypothesis,  $\alpha$  does not contain as substring 10, 1S, S0, SS, T0, or TS.

- If the last derivation step uses  $S \longrightarrow 0S$ , since  $\alpha$  does not contain 1S or TS, the derivation step cannot introduce 10 or T0 in  $\beta$ .

- If the last derivation step uses  $S \rightarrow 1T$ , since  $\alpha$  does not contain  $S0$  or  $SS$ , the derivation step cannot introduce  $T0$  or  $TS$  in  $\beta$ .
- If the last derivation step uses  $S \rightarrow 0$ , since  $\alpha$  does not contain  $1S$ ,  $SS$ , or  $TS$ , the derivation step cannot introduce  $10$ ,  $S0$ , or  $T0$  in  $\beta$ .
- If the last derivation step uses  $T \rightarrow 1T$ , since  $\alpha$  does not contain  $T0$  or  $TS$ , the derivation step cannot introduce  $T0$  or  $TS$  in  $\beta$ .
- If the last derivation step uses  $T \rightarrow 1$ , since  $\alpha$  does not contain  $T0$  or  $TS$ , the derivation step cannot introduce  $10$  or  $1S$  in  $\beta$ .
