# DigitHist: a Histogram-Based Data Summary with Tight Error Bounds

Michael Shekelyan, Anton Dignös, Johann Gamper (Free University of Bozen-Bolzano)

**VLDB** 43<sup>rd</sup> International Conference on Very Large Data Bases

## Motivation for Data Summaries

### **Data Management**

 selectivity estimation to help guide query optimization

### **Data Analysis**

 approximate query answering in DSS/OLAP systems

## Data Summaries for Range Queries

#### data points

#### data

 multi-dimensional points in euclidean space

#### multi-dimensional histogram

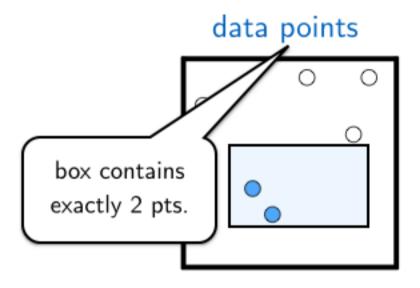

1		1	1
			1
	2		

#### summary

 data structure approximating no. of points in any query box

# Data Summaries for Range Queries

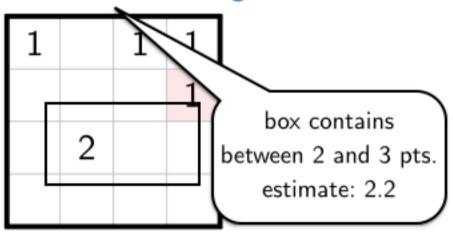

#### data

 multi-dimensional points in euclidean space

#### multi-dimensional histogram

#### summary

 data structure approximating no. of points in any query box

### Related Work

sampling		multi-dim. histograms	ε-approximation	DigitHist (proposed)
references	TOMS'85	SIGMOD'99,'00	SCG'04, SODA'13,	VLDB'17
basic idea	take random subset	split space into buckets	quantile-based or sampling	count along regular grids
for more data?	very good	ok	ok	good
for few dims.?		good good		good
for more dims.? very good		bad	bad	ok
error bounds?	only confidence intervals	individual for each query	same for all datasets and queries	individual for each query

other notable approaches:

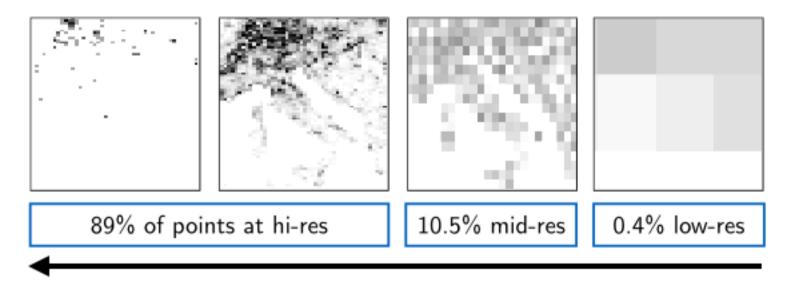

• Wavelets, DCT, Kernel Density Estimation, Dyadic Decomposition (e.g., Sketches)

## DigitHist Key Idea

#### digit histograms

- summarize majority of points at higher resolution
  - e.g. 89.1% at 1024×1024 (99.6% of points at 512×256 or higher)
- summarize remaining points at lower resolution

increasing impact on precision

## DigitHist: Initial Histograms

### initial histograms

- create in single scan
- materialize only nonempty buckets
- sufficiently precise
- too large
- (and slow to query)

# DigitHist: Digit Histograms

### digit histograms

- · split counts by digits
- treat digit histograms differently

# DigitHist: Lossy compression / u-error

#### lossy compression

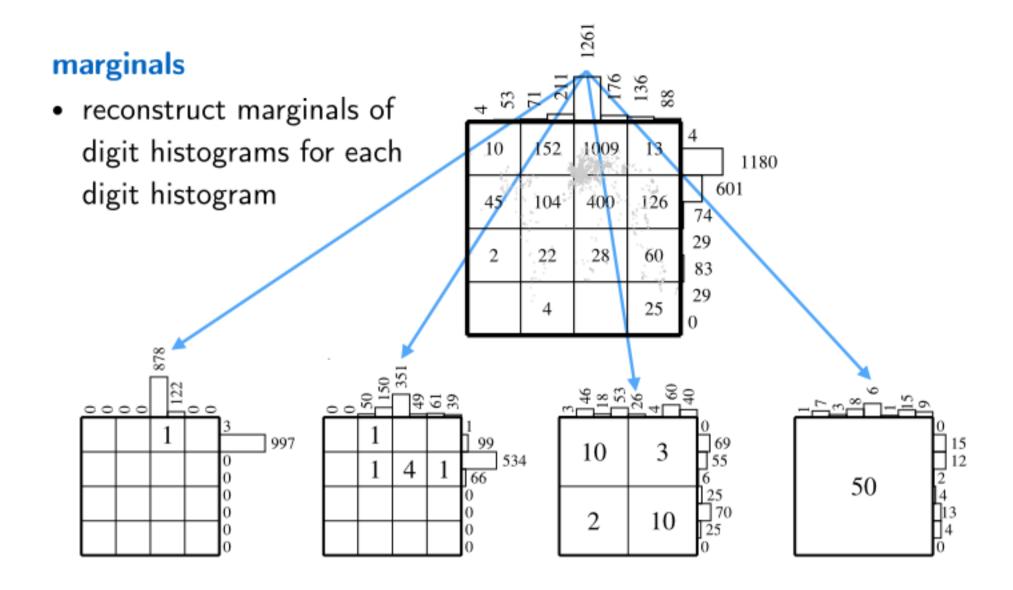

- targeted size
- pick resolutions minimizing u-error

#### u-error

- expected width of bounds
- random query box
- uniform in location and size

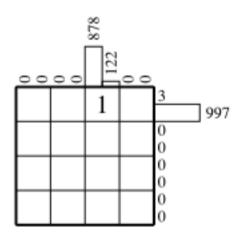

# DigitHist: Accompany with Marginals

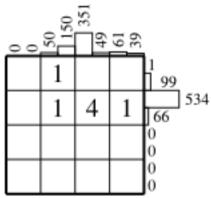

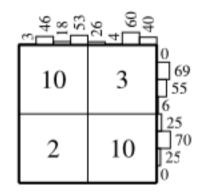

## DigitHist

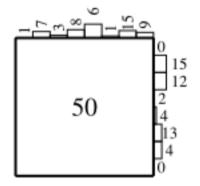

#### final summary

- four multi-dimensional histograms
- · accompanied by hi-res marginal histogram in each dimension

## Intra-Bucket Assumption

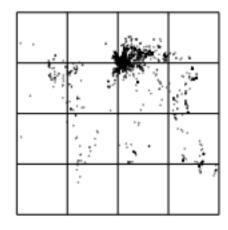

#### problem

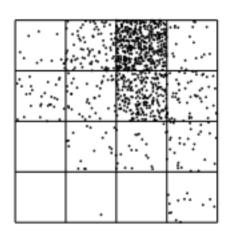

- location of points inside buckets not stored and needs to be estimated
- assuming uniformity inside buckets assumes uniformity in marginals

### DigitHist intra-bucket spread

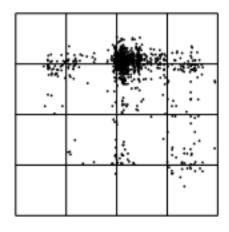

- spread points using marginal histograms and assuming independence
- no significant query time overhead

data points

multidim. hists.

DigitHist

## Properties of DigitHist

#### efficient construction

- data can be treated as stream (single-pass)
- user-controlled memory usage (2GB in our experiments)
- construction time linear in data size, data dim. and summary size

#### convenient storage

· stored and queried as byte stream

#### fast, light-weight querying

 time linear in summary size and no significant memory usage precision

 query-individual estimates and error bounds updatability

reconstruct from updated regular grid histogram in secondary storage

## Experimental Setup

#### datasets

- OpenStreetMap 46.4 GB(2D spatial data)
- HIGGS 616 MB (7D scientific data)
- Zipf/Gauss ≤1.2GB (2-16D synthetic data)

#### methodology

- construct all tested data summaries.
- randomly create ranges with low selectivity (1-5%).
- compute avg. estimates and bounds of tested summaries.

#### precision measures

- relative error = (estimate correct) / correct
- relative width of bounds = (width of bounds) / correct

## Construction Time

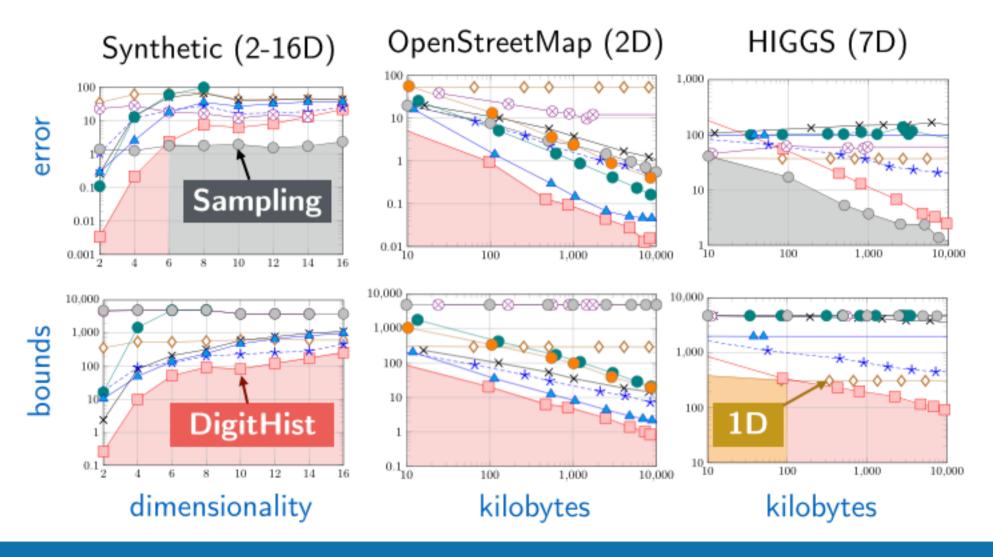

- DigitHist can be constructed in a few minutes
- simple summaries faster to construct (but less precise)
- quantile-based summaries take hours to construct

datasets	OSM (2D	- 46.4 GB)	HIGGS (7D - 616 MB)		
summary size	100kB 1MB		100kB	1MB	
DigitHist	16 mins	17 mins	35 secs	3 mins	
1d Histograms	3 mins	3 mins	2 secs	3 secs	
Equi-Width	5 mins	5 mins	2 secs	3 secs	
Equi-Depth	2.2 hours	2.5 hours	29 secs	34 secs	
Wei-Yi	2.5 hours	3.1 hours			
Cross GK	1 hour	2.1 hours	20 mins	40 mins	

### Precision: Errors and Bounds

- <6D: DigitHist smallest error and bounds</li>
- ≥6D: Sampling smallest error and DigitHist tightest bounds

## Summary

### DigitHist

- aggregate data along regular grids
- split counts by digits
- aggregate denser data regions at higher resolution
- integrate high-res one-dimensional histograms

#### u-error

- measures precision to guides lossy compression of DigitHist
- takes histogram and computes its expected width of bounds
- assumes uniform distribution of queries

### experimental results

- <6D: DigitHist smallest error and bounds</li>
- ≥6D: Sampling smallest error and DigitHist smallest bounds

### Outlook

### **DigitHist**

- optimize summary for known workload
- deal with mix of categorical, discrete and real attributes
- try to improve performance for more dimensions

### beyond DigitHist

 lower-dimensional summaries with ultra-fast query times and theoretical guarantees

# Thank you for attention!
